90 00977 (120V AC)

## SAFETY NOTICE

## PRODUCT SAFETY NOTICE

Components identified by  $\triangle$  or  $*$  have SPECIAL CHARACTERISTICS IMPORTANT TO SAFETY. Before replacing any of these components, read carefully the service safety precautions.

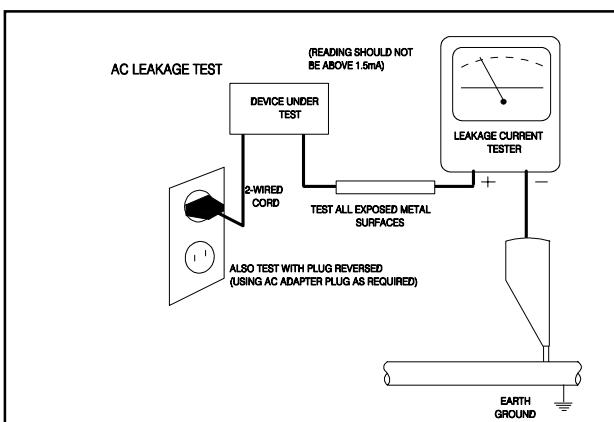

**DO NOT DEGRADE THE SAFETY OF THIS SET THROUGH  
IMPROPER SERVICING.**

## SAFETY NOTICE

Components having special safety characteristics are identified by  $\triangle$  on schematics and on the parts list in this SERVICE MANUAL and its supplements and bulletins. Before servicing this apparatus, it is important that the service technician read and follow the "SAFETY PRECAUTIONS" and "PRODUCT SAFETY NOTICES" in this Service Manual.

## SAFETY PRECAUTIONS

1. Before returning an instrument to the customer, always make a safety check of the entire instrument, including, but not limited to, the following items :
  - a. Be sure that no built-in protective devices are defective and/or have been defeated during servicing. (1) Protective shields are provided on this chassis to protect both the technician and the customer. Correctly replace all missing protective shields, including any removed for servicing convenience. (2) When reinstalling the chassis and/or other assembly in the cabinet, be sure to put back in place all protective devices, including, but not limited to, insulating materials, barriers, covers/shields, and isolation resistor/capacitor networks. **Do not operate this instrument or permit it to be operated without all protective devices correctly installed and functioning.** Servicers who defeat safety features or fail to perform safety checks may be liable for any resulting damage.
  - b. Be sure that there are no cabinet openings through which an adult or child might be able to insert their fingers and contact a hazardous voltage. Such openings include, but are not limited to, (1) excessively wide cabinet ventilation slots, and (2) an improperly fitted and/or incorrectly secured cover panels.
  - c. **Leakage Current Hot Check** - With the instrument completely reassembled, plug the AC line cord directly into a 220 V AC outlet. (Do not use an isolation transformer during this test.) Use a leakage current tester or a metering system that complies with American National Standards Institute (ANSI) C101.0 Leakage Current for Appliances and Underwriters Laboratories (UL) 1410, (50.7). With the instrument AC switch first in the on position and then in the off position, measure from a known earth ground (metal waterpipe, conduit, etc.) to all exposed metal parts of the instrument (antennas, handle bracket, metal cabinet, screwheads, metallic overlays, control shafts, etc.) especially any exposed metal parts that offer an electrical return path to the chassis. Any current measured must not exceed 1.5 milliamp. Reverse the instrument power cord plug in the outlet and repeat test.  
**ANY MEASUREMENTS NOT WITHIN THE LIMITS SPECIFIED HEREIN INDICATE A POTENTIAL SHOCK HAZARD THAT MUST BE ELIMINATED BEFORE RETURNING THE INSTRUMENT TO THE CUSTOMER OR BEFORE CONNECTING ACCESSORIES.**
- d. **X-Radiation and High Voltage** - Because the picture tubes are the primary potential source of X-radiation in solid-state projectors, they are specially constructed to prohibit X-radiation emissions. For continued X-radiation protection, the replacement picture tube must be the same type as the original. Also, because the picture tube shields and mounting hardware perform an X-radiation protection function, they must be correctly in place. After replacement of any X-ray radiation related safety components (marked in this manual with an \*), the EHT voltage board must be checked.
2. Read and comply with all caution and safety-related notes on or inside the projector cabinet or on the projector chassis, or on the picture tube.
3. **Design Alteration Warning** - Do not alter or add to the mechanical or electrical design of this apparatus. Design alterations and additions, including, but not limited to, circuit modifications and the addition of items such as auxiliary audio and/or video output connections, might alter the safety characteristics of this apparatus and create a hazard to the user. Any design alterations or additions may void the manufacturer's warranty and may make you, the servicer responsible for personal injury or property damage resulting therefrom.
4. **Picture Tube Implosion Protection Warning** - The picture tube in this projector encloses a high vacuum. Do not remove, install, or otherwise handle the picture tube in any manner without first putting on shatterproof goggles equipped with side shields. People not so equipped must be kept safely away while picture tubes are handled. Keep the picture tube away from your body. Do not handle the picture tube by its neck. For continued implosion protection, replace the picture tube only with one of the same type number.
5. **Hot Chassis Warning** - This projector chassis has two ground systems: the primary ground system is formed by the negative voltage of the rectified mains (power) and is only used as a reference in primary circuits; the secondary ground system is connected to earth ground via the earth conductor in the mains (power) lead. Separation between primary and secondary circuits is performed by the safety isolation transformers. Components bridging this transformers are also safety components and must never be defeated or altered. All user-accessible conductive parts must be connected to earth ground, or are kept at SELV (Safety Extra Low Voltage).
6. Observe original lead dress. Take extra care to assure correct lead dress in the following areas:
  - a. near sharp edges,
  - b. near thermally hot parts - be sure that leads and components do not touch thermally hot parts,
  - c. the AC supply,
  - d. high voltage.
 Always inspect in all areas for pinched, out-of-face, or frayed wiring. Do not change spacing between components, and between components and the printed-circuit board. Check AC power cord for damage.
7. Components, parts, and/or wiring that appear to have overheated or are otherwise damaged should be replaced with components, parts, or wiring that meet original specifications. Additionally, determine the cause of overheating and/or damage and, if necessary, take corrective action to remove any potential safety hazard.

**WARNING: RISK OF ELECTRIC SHOCK DURING THIS TEST.  
THE PROJECTOR IS NOT CONNECTED TO GROUND.  
DO NOT TOUCH THE PROJECTOR AND USE WELL INSULATED  
TEST PROBES.**

**8. PRODUCT SAFETY NOTICE** - Many electrical and mechanical parts have special safety-related characteristics some of which are often not evident from visual inspection, nor can the protection they give necessarily be obtained by replacing them with components rated for higher voltage, wattage, etc. Parts that have special safety characteristics are identified in BARCO service data by  on schematics and in the parts list. Use of a substitute replacement that does not have the same safety

characteristics as the recommended replacement part in BARCO service data parts list might create shock, fire, and/or other hazards. Product Safety is under review continuously and new instructions are issued whenever appropriate. For the latest information, always consult the appropriate current BARCO service literature.

## SERVICING PRECAUTIONS

**CAUTION:** Before servicing instruments covered by this service data and its supplements and addendums, read and follow the SAFETY PRECAUTIONS of this publication.

**NOTE:** If unforeseen circumstances create conflict between the following servicing precautions and any of the safety precautions on page 2 of this publication, always follow the safety precautions.

Remember: Safety First.

### General Servicing Precautions

1. Always unplug the instrument AC power cord from the AC power source before:
  - a. Removing or reinstalling any component, circuit board, module, or any other instrument assembly.
  - b. Disconnecting or reconnecting any instrument electrical plug or other electrical connection.
  - c. Connecting a test substitute in parallel with an electrolytic capacitor in the instrument.

**Caution:** A wrong part substitution or incorrect polarity installation of electrolytic capacitors may result in an explosion hazard.

2. Do not spray chemical on or near this instrument or any of its assemblies.
3. Unless specified otherwise in this service data, clean electrical contacts by applying the following mixture to the contacts with a pipe cleaner, cotton-tipped stick or comparable nonabrasive applicator: 10% (by volume) Acetone and 90% (by volume) isopropyl alcohol (90%-99% strength). **Caution:** This is a flammable mixture.

Unless specified otherwise in this service data, lubrication of contacts is not required.

4. Do not defeat any plug/socket B+ voltage interlocks with which instruments covered by this service data might be equipped.
5. Do not apply AC power to this apparatus and/or any of its electrical assemblies unless all solid-state device heat sinks are correctly installed.
6. Always connect the test instrument ground lead to the appropriate instrument chassis ground before connecting the test instrument positive lead. Always remove the test instrument ground lead last.
7. Use with this instrument only the test fixtures specified in this service data.

**CAUTION:** Do not connect the test fixture ground strap to any heatsink in this instrument.

### Electrostatically Sensitive (ES) Devices

Some semiconductor (solid state) devices can be damaged easily by static electricity. Such components commonly are called Electrostatically Sensitive (ES) Devices. Examples of typical ES devices are integrated circuits and some field-effect transistors and semiconductor "chip" components. The following techniques should be used to help reduce the incidence of component damage caused by static electricity.

1. Immediately before handling any semiconductor component or semiconductor-equipped assembly, drain off any electrostatic charge on your body by touching a known earth ground. Wear a commercially available high impedance discharging wrist strap device.
2. After removing an electrical assembly equipped with ES devices, place the assembly on a static dissipative surface such as a 3M No 8210 table mat, to prevent electrostatic charge buildup or exposure of the assembly.
3. Use only a grounded-tip soldering iron to solder or unsolder ES devices.
4. Use only an anti-static type solder removal device. Some solder removal devices not classified as "anti-static" can generate electrical charges sufficient to damage ES devices.
5. Do not use freon-propelled chemicals. These can generate electrical charges sufficient to damage ES devices.
6. Do not remove a replacement ES device from its protective package until immediately before you are ready to install it. (Most replacement ES devices are packaged with leads electrically shorted together by conductive foam, aluminium foil or comparable conductive material.)
7. Immediately before removing the protective material from the leads of a replacement ES device, touch the protective material to the chassis or circuit assembly into which the device will be installed.  
**CAUTION:** Be sure no power is applied to the chassis or circuit, and observe all other safety precautions.
8. Minimize bodily motions when handling unpackaged replacement ES devices. (Otherwise harmless motion such as the brushing together of your clothes fabric or the lifting of your foot from a carpeted floor can generate static electricity sufficient to damage an ES device.)

**General Soldering Guidelines**

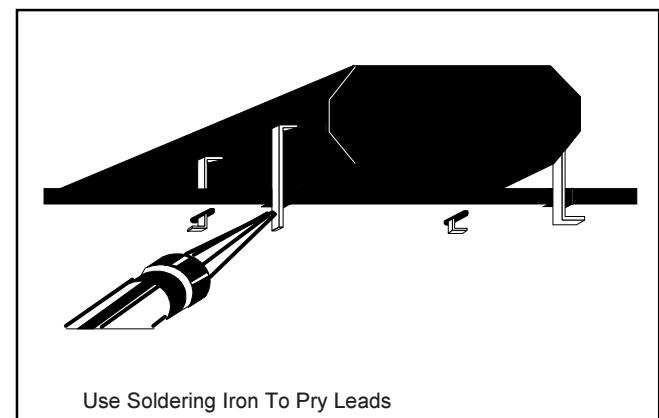

1. Use a grounded-tip, low-wattage soldering iron and appropriate tip size and shape that will maintain tip temperature within the range 260°C to 315°C.
2. Use an appropriate gauge of RMA resin-core solder composed of 60 parts tin/40 parts lead.
3. Keep the soldering iron tip clean and well tinned.
4. Thoroughly clean the surfaces to be soldered. Use a small wire-bristle (0.5 inch, or 1.25 cm) brush with a metal handle. Do not use freon-propelled spray-on cleaners.
5. Use the following unsoldering technique:
  - a. Allow the soldering iron tip to reach normal temperature (260°C to 315°C).
  - b. Heat the component lead until the solder melts.
  - c. Quickly draw away the melted solder with an anti-static, suction-type solder removal device or with solder braid.
- CAUTION: Work quickly to avoid overheating the circuit board printed foil.
6. Use the following soldering technique:
  - a. Allow the soldering iron tip to reach normal temperature (260°C to 315°C).

b. First, hold the soldering iron tip and solder strand against the component lead until the solder melts.

c. Quickly move the soldering iron tip to the junction of the component lead and the printed circuit foil, and hold it there only until the solder flows onto and around both the component lead and the foil.

**CAUTION:** Work quickly to avoid overheating the circuit board printed foil or components.

d. Closely inspect the solder area and remove any excess or splashed solder with a small wire-bristle brush.

## GENERAL INFORMATION

# BARCOGRAPHICS 1209s

## Ultra-High Resolution Graphics Projector

The BARCOGRAPHICS 1209s is a new ultra-high resolution graphics projector designed to provide superlative performance, not only by today's standards, but by tomorrow's as well. Its unequalled flexibility, combined with an almost limitless display compatibility, promote the BARCOGRAPHICS 1209s as the ideal solution for demanding applications such as: industrial design, simulation, process control and traffic management centres, as well as military command & control centres (C<sup>3</sup>I) and other applications where image quality can not be compromised.

### Ultra wide compatibility

The BARCOGRAPHICS 1209s features a display compatibility from VHS video up to 2,500 by 2,000 pixel workstations.

- Horizontal autolock scan frequency range of 15-135 kHz
- 120 MHz RGB amplifiers
- Universal signal connection facilities

### Very high resolution images

The BARCOGRAPHICS 1209s renders high resolution large screen images with unprecedented visual fidelity.

- Improved, ultra-high definition, liquid cooled 9" electromagnetic focus CRTs with digitally controlled dynamic astigmatism guarantee razor sharp images
- Super-high definition liquid coupled F1.15 lenses provide outstanding image contrast
- State-of-the-art electronic circuitry result in better geometry, unequalled sharpness and true colour projection
- Optional high quality Line Doubler for improved Video image quality

### Unequaled flexibility

- Built-in Scheimpflug optical correction, with stepless adjustment, for optimal optical focus for projection under non-standard angles
- A series of options for multi-screen applications, non-standard projection angles,...
- Different lens options are available, optimised for a wide range of screen sizes from 2 m (6.6 ft.) to 8.8 m (29 ft.) wide
- Built-in IRIS<sup>2</sup> automatic convergence system aligns on-screen convergence in less than 2.5 minutes

## New!

Now with Built-in  
IRIS<sup>2</sup> Auto-Convergence

# High precision graphics projection system

## Ultra-high resolution, highly flexible optical system

### Improved resolution

The BARCOGRAPHICS 1209s is equipped with improved, ultra-high definition, liquid cooled 9" CRTs with an advanced electromagnetic focus system and digitally controlled dynamic astigmatism, which guarantees razor sharp projected images, even at maximum contrast levels.

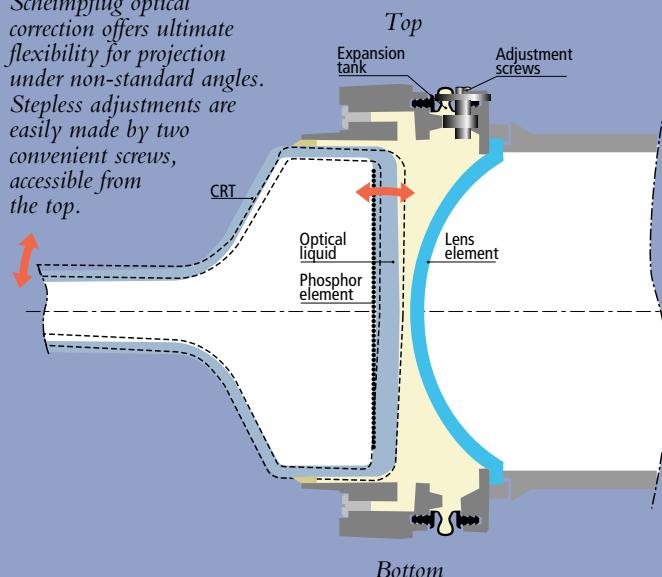

Super-high definition, fully colour corrected, liquid coupled F1.15 lenses provide outstanding image contrast. Several types of lenses are available, optimised for a wide range of screen sizes.

### Optical Scheimpflug correction

The BARCOGRAPHICS 1209s features a new, precision Scheimpflug optical correction system with stepless adjustments for both horizontal and vertical axes. Unlike conventional projectors, these adjustments can easily be made while looking at the projected image.

This results in a highly effective means of achieving near perfect focus uniformity from left to right and top to bottom, even under non-standard angles.

*BARCO's built-in Scheimpflug optical correction offers ultimate flexibility for projection under non-standard angles. Stepless adjustments are easily made by two convenient screws, accessible from the top.*

### Built-in IRIS<sup>2</sup> auto-convergence system

A built-in IRIS<sup>2</sup> automatic convergence system automatically aligns the three projected images faster and with more accuracy than ever before possible through the conventional manual process.

### Secure design

The BARCOGRAPHICS 1209s has been designed for extremely low RFI/EMI emissions (FCC Rules & Regulations part 15 Class B for 120 V version and CE EN55022 Class B for 230 V version) for demanding military and industrial applications where unwanted interference could compromise critical communications lines.

### Flexible installation possibilities

BARCO offers a series of special options for non-standard applications (multi-screen applications, non-standard projection angles,...). For specialised applications, BARCO can provide unique projector configurations, which are custom tailored to specific application requirements.

*The 100 % modular construction of the BARCOGRAPHICS 1209s allows easy access to all controls and facilitates quick servicing.*

# Technical specifications

Lens types	HD120	HD180	HD300
F number	F1.15	F1.15	F1.15
Screen width meter feet	2-3 6.6-10	3-4.2 10-14	2-8.8 6.6-29
Optical resolution	12 lp/mm	12 lp/mm	10 lp/mm
Standard/optional	Standard	Optional	Optional

The BARCOGRAPHICS 1209s can be equipped with different lenses, optimised for particular screen sizes.

## Light output

At 10 % peak white: 1,250 lumens  
 ANSI lumen<sup>(1)</sup>  
 Economy mode: 195 lumens  
 Normal mode: 240 lumens  
 Boost mode: 270 lumens

## CRTs

New, improved, high brightness, high definition liquid cooled 9" CRTs with electromagnetic focus

## Lenses

Super high definition, liquid coupled, fully colour corrected F1.15 lenses, optimised for particular screen sizes (see table)

## Scan frequencies

Horizontal: 15-135 kHz autolock  
 Vertical: 37-200 Hz autolock

## Minimal retrace time

Horizontal:  
 < 2.5 µs in range 15-90 kHz  
 < 1.25 µs in range 64-135 kHz  
 (switching point adjustable between 64 and 94 kHz)  
 Vertical: < 200 µs

## Max. compatible display resolution

2,500 x 2,000

## RGB bandwidth

120 MHz [-3 dB]

## Horizontal linearity

< ±1.5 % distortion throughout the full horizontal frequency range

## Inputs

- RGB or (Y, R-Y, B-Y) input on 5 BNC-connectors, with automatic sync detection and sync polarity, with sync on green or separate sync

- RGB analog input on D9-connector, with automatic sync detection and polarity (optional D9-BNC adapter available)
- Video (PAL, SECAM, NTSC 3.58, NTSC 4.43), loop-through (2xBNC) with 75 Ohm termination switch
- S-Video input (4-pin mini-DIN), loop through with 75 Ohm termination switch (can also be programmed as a second Video input)

## Remote control

A backlit user-friendly infrared remote control for control of:

- Source switching
- User settings per source (brightness, contrast, colour, hue, sharpness)
- Geometry per source (password protectable)
- Convergence per source (password protectable)

An optional executive remote control unit is available for control of source switching and user settings per source.

## Special features

- CRT drive in 3 modes: normal mode, economy mode for longer life time of the CRTs, and boost mode for high performance applications
- Optional high quality Line Doubler for improved Video image quality
- On-screen menus selectable between English, French, German and Spanish
- 32 frequency-related memory banks
- LDI (Linear Digital Interpolation)
- Effective on-screen display: installation screens, barscale display of user settings, on-screen display of source frequencies

- Automatic storing of all adjustments
- Ability to set parameters to midposition
- Colour temperature adjustment (3200 K, 4900 K, 6500 K, 9300 K or custom)
- D.D.A. (Digital Dynamic Astigmatism) guarantees superb focus quality from centre to corners of projected image
- 100 % modular construction: allows easy access to all controls and facilitates quick servicing
- 'Seagull' correction to improve corner geometry
- Separate East-West corrections for left and right side
- Built-in projection distance calculator
- Built-in IRIS<sup>2</sup> automatic convergence unit
- A built-in Scheimpflug optical correction, with stepless adjustments for both horizontal and vertical axis guarantees optimal optical focus from left to right and top to bottom for projection under non-standard angles.

## AC power consumption

590 W max [230 VAC +15%/-10%]

## Safety regulations

The BARCOGRAPHICS 1209s complies with UL 1950 and EN60950.

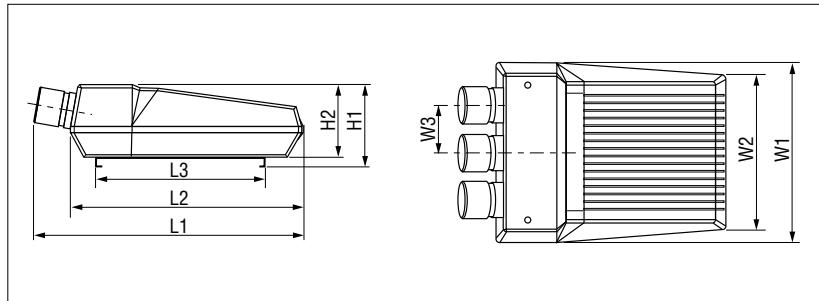

## Electromagnetic interference

The BARCOGRAPHICS 1209s complies with FCC Rules & Regulations, part 15 Class B (120 V version) and CE EN55022 Class B (230 V version).

## Radiation regulations

The BARCOGRAPHICS 1209s complies with DHHS radiation emission standards 21 CFR Subchapter J.

(1) Measurement method conforms to ANSI IT7.215 standard.

<b>Dimensions</b>	<b>mm</b>	<b>inch</b>
L1	1,174	46.2
L2	1,014	39.9
L3	735	28.9
H1	355	13.9
H2	315	12.4
W1	782	30.8
W2	665	26.2
W3	208	8.2

# Nomenclature :

# Schematics

## Linking signals on a sheet.

Those symbols represent a signal (name) which is generated on another place of the same sheet.

Those symbols represent a signal (name) which is generated on this place and used further on the same sheet.

Those symbols represent a signal (name) which is bidirectional and used on the same sheet only.

## Linking signals across sheets.

Those symbols represent a signal (name) which is generated on another sheet.

Those symbols represent a signal (name) which is generated on this place and used further on other sheets always and possible on the same.

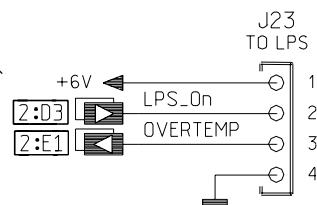

Those symbols represent a signal (name) which is bidirectional and used on other sheets.

## Explanation about sheet pointer text.

The sheet pointer text gives us the sheet number and the coordinates from where or to where a signal flows. It contains two parts separated by ":". The first part is a digit which represent the sheet number. The second part contains a character followed by a digit, those are respectively horizontal and vertical coordinates.

Sheet pointer text

## Nomenclature about voltage supplies

	Supply voltage	-12VB	+12V	+380VMA
	Ground	+19VB	--13V	++22VMA
	Mains ground	GNDM		
	Protected earth	GNDB		GNDMA

PREFIX

- + Positive supply voltage
- Negative supply voltage
- ++ Positive standby voltage
- Negative standby voltage

SUFFIX

- A Part "A" or Analog (depends on design)
- B Part "B"
- C Part "C"
- D Part "D" or Digital (depends on design)
- M Mains
- V Volt

## Operational mode

According to Table above, the SAA 1250 operates in two modes, which are determined via the OA and OB address input (see table on preceding page).

The first command is given about 20ms after contact actuation. All following commands are sent periodically every 130 ms.

The signals are transmitted by means of infrared light in the shape of packages pulses. For the transmission of a 10-bit word, 14 pulses are required. The binary information of a bit is contained in the time interval between two pulses. We define the time T (approx. 100us) as the basis for the code to be employed.

Duration T = binary digit "0"  
Duration 2T = binary digit "1"  
Spacing between preliminary pulse and start pulse 3T. This is followed after a 1T by the 11 data pulses and terminated after a 3T interval by the stop pulse.

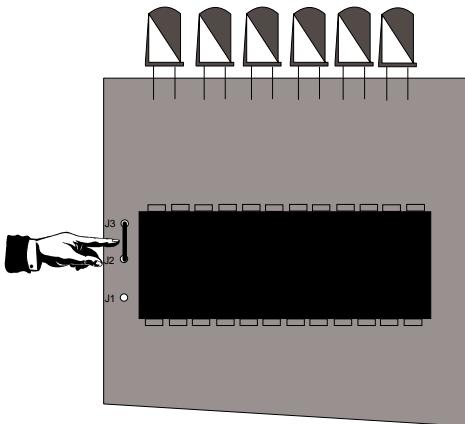

# Transmitter RCU (Remote Control Unit)

R791664

## Only for the Infra Red Remote control

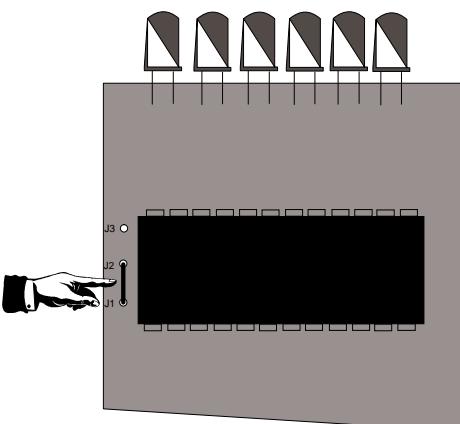

The OPTION III and the FREE ADDRESS SELECTION (FAS) are defined in the remote control RCU800 by means of an inserted jumper on the printed circuit board, see PCB lay-out.

### FIXED ADDRESS SELECTION MODE

First signal is transmitted 20ms after key depression, further signals periodically in a distance of 130ms with Address 10.

### FREE ADDRESS SELECTION MODE

First signal is transmitted 20ms after key depression, further signals every 130ms.

The commands can be transmitted consecutively to various addresses with free address selection.

In this mode the required address must be initially entered into the address register of the transmitter IC SAA1250, using one of the commands 17 to 32. Then all following commands are transmitted together with the stored address, including commands 17 to 32.

The command 33 (FAS off) clear , under the conditions of a L signal permanently applied to both address inputs, only the address register.

## Support signals

# RGB input+Switching module

R762719

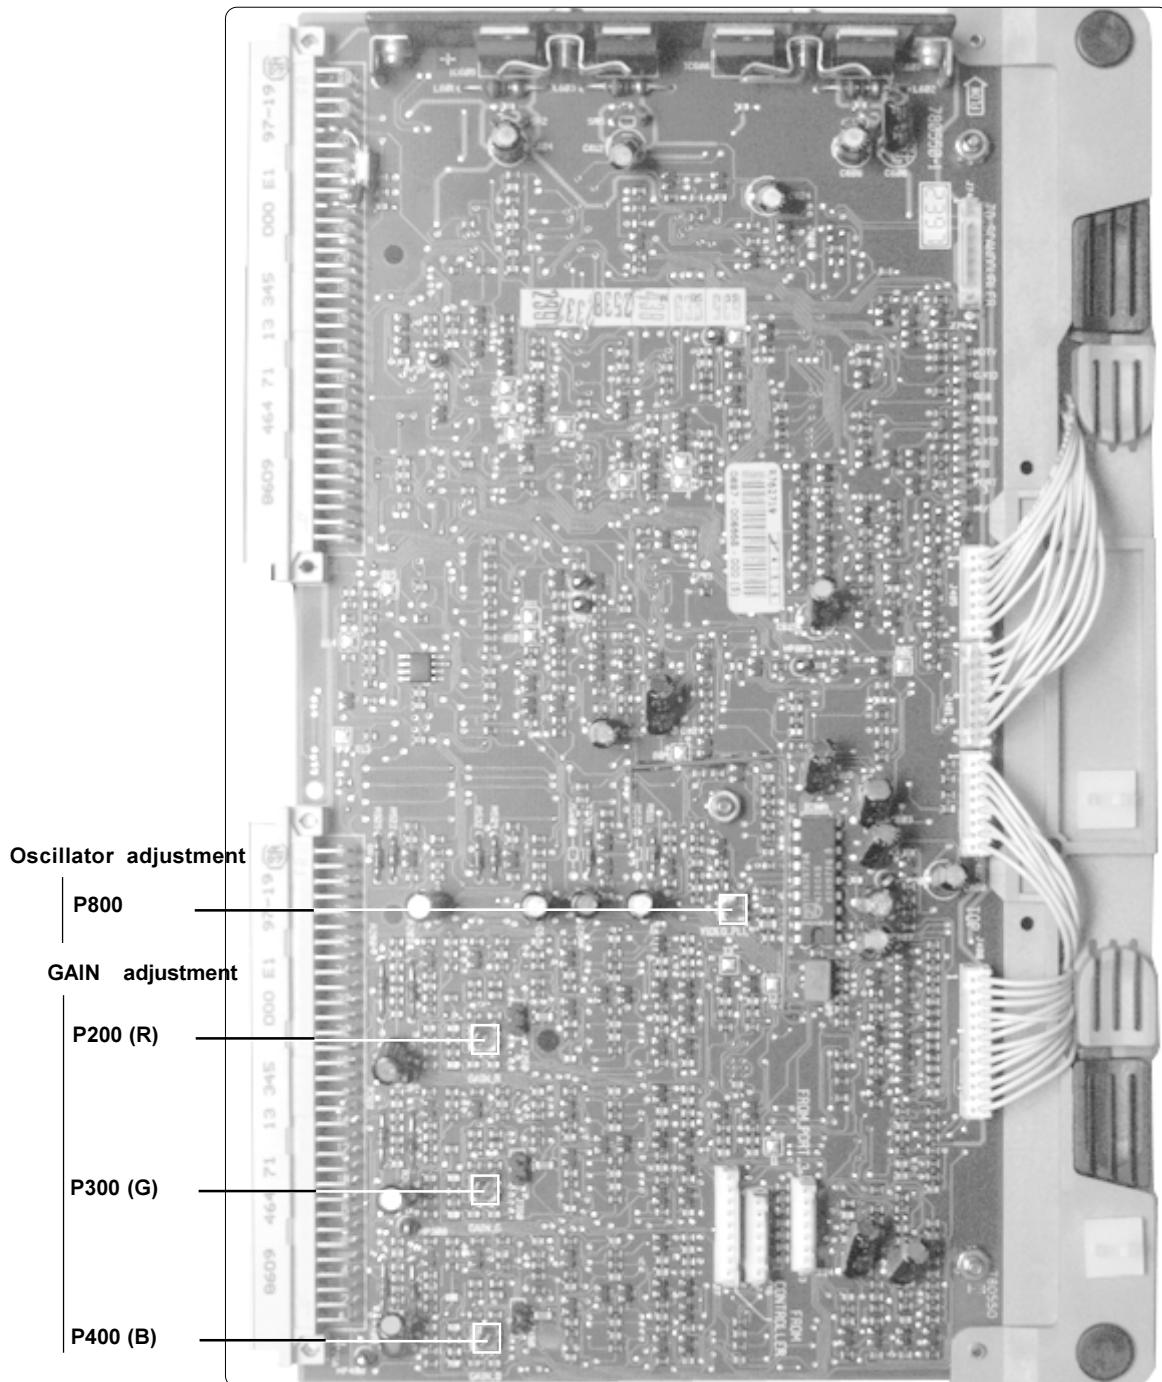

## Adjustment procedure for the RGB Input + Driver module

### 1. Adjustments on the module:

- Adjustment of the GAIN for Red (P200), Green (P300) and Blue (P400).
- Adjustment of the duty cycle of the Horizontal Oscillator to 64us (P800) in free-running mode.

### 2. Location of the controls

## 3. Adjustments

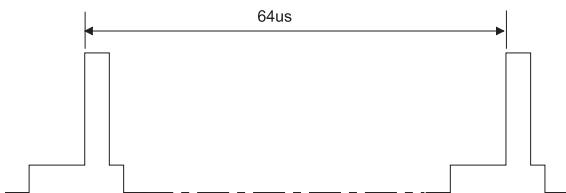

### A. Adjustment of the Duty Cycle of the Oscillator P800

#### A1. Signal input:

No input selected (no signal)

#### A2. Adjustment of the duty cycle of the Oscillator in the IC 801 TDA2579A

- Connect an oscilloscope to pin 2 of the connector J400.
- Adjust the potentiometer P800 for a duty cycle of the Sandcastle pulse of 64us.

### B. Input GAIN adjustment For Red (P200), Green (P300) and Blue (P400)

#### B1. Input GAIN adjustment Red (P200) channel

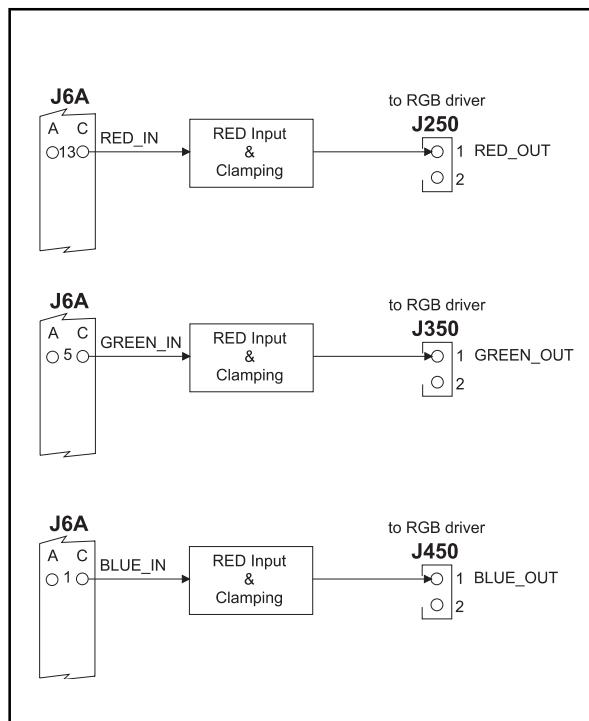

- Connect a RGB/S signal to the RGB-HS/CS inputs and select RGB/S.
- Connect one probe of the double beam oscilloscope to the RED\_IN signal and the other to RED\_OUT, pin 1 of the board connector J250.
- Adjust the potentiometer P200 for a signal aspect ratio In/Out of 1.

#### B2. Input GAIN adjustment Green (P300) channel

- Connect a RGB/S signal to the RGB-HS/CS inputs and select RGB/S.
- Connect one probe of the double beam oscilloscope to the GREEN\_IN signal and the other to GREEN\_OUT, pin 1 of the board connector J350.
- Adjust the potentiometer P300 for a signal aspect ratio In/Out of 1.

#### B3. Input GAIN adjustment Blue (P400) channel

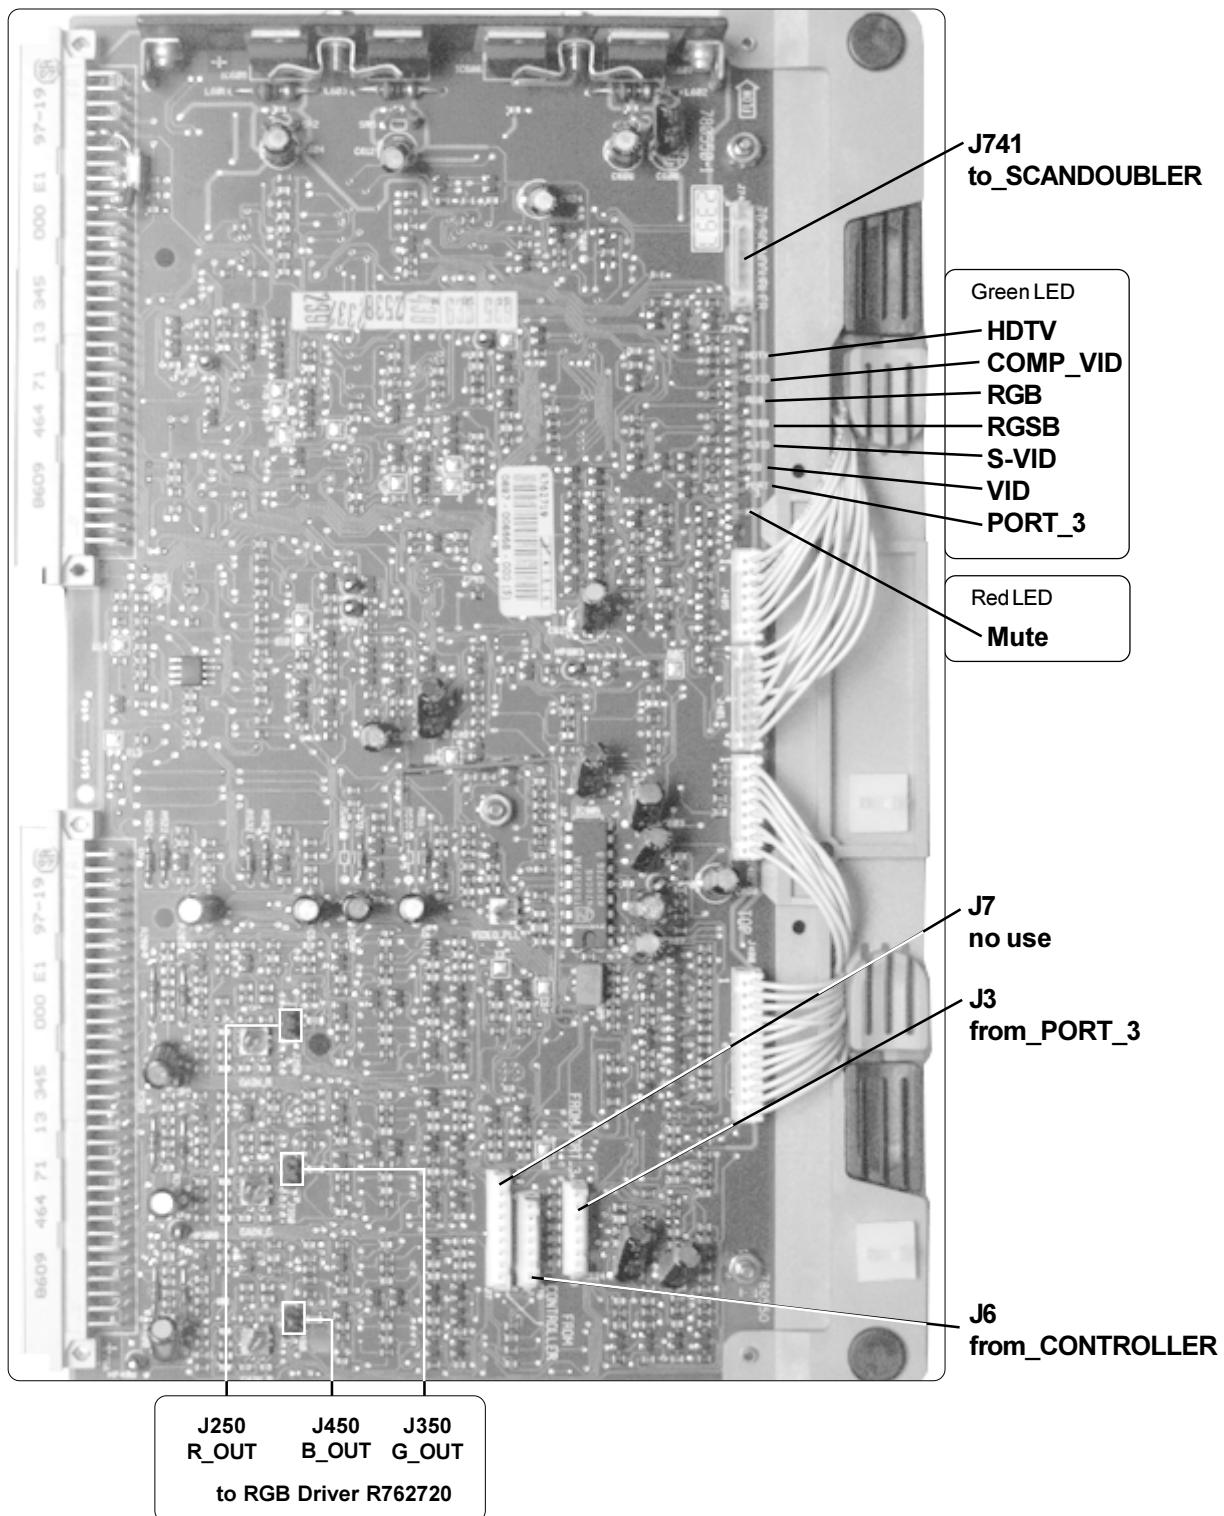

- Connect a RGB/S signal to the RGB-HS/CS inputs and select RGB/S.
- Connect one probe of the double beam oscilloscope to the BLUE\_IN signal and the other to BLUE\_OUT, pin 1 of the board connector J450.
- Adjust the potentiometer P400 for a signal aspect ratio In/Out of 1.

# RGB input+Switching module

R762719

## Connections /Control LED's on the module

# RGB input+Switching module

R762719

## Connections

### Connector J3 (from second RGB input)

pin 1	GND		GROUND
pin 2	R(2RGB)	1Vpp	RED Video input signal from second RGB analog input
pin 3	GND		GROUND
pin 4	G(2RGB)	1Vpp	GREEN Video input signal from second RGB analog input
pin 5	GND		GROUND
pin 6	B(2RGB)	1Vpp	BLUE Video input signal from second RGB analog input
pin 7	GND		GROUND

### Connector J6A (frame connection)

pin 1	B IN	1Vpp	BLUE Video input (BNC) signal (Source 4,5)
pin 5	G IN	1Vpp	GREEN Video input (BNC) signal (Source 4,5)
pin 13	R IN	1Vpp	RED Video input (BNC) signal (Source 4,5)
pin 17	HS IN	0.3..5Vpp	Ext. Horizontal/composite Sync input (Source 4,5)
pin 21	VS IN	0.3..5Vpp	Ext. Vertical Sync input (Source 4,5)
pin 25	VIDIN	1Vpp	Video composite input signal (Source 1)
pin 2/6/14/18/22/26		GND	GROUND

### Connector J6B (frame connection)

pin 1	CP	TTL	Output Clamp pulses to RGB driver
pin 2	VS	1Vpp	Output Vertical Sync Pulses to Vert. Deflection
pin 4	HS	1Vpp	Output Hor./Composite Sync Pulses to Vert. Deflection
pin 7	Y IN	1Vpp	Ext.Luma signal input (Source 2)
pin 12	C IN	0.3Vpp	Ext.Chroma signal input
pin 19	I2CINT	TTL	Open collector I2C Interrupt line
pin 21	SC	2 level	Input Sandcastle from TDA2595
pin 22	F/S	Hi Z	Output Fast/Slow (open collector)
pin 24	SCL	TTL	I2C Clock
pin 25	SDA	TTL	I2C Data
pin 26	+PORT3		Selection Port 3 (+12V for source 3)
pin 27	+S VID		Selection S-Video (+12V for source 2)
pin 28	+RGsB		Selection RGsB (+12V for source RGsB)
pin 29	+VID		Selection Video (+12V for source 1 & 2)
pin 30	-17V		Power Supply -17V DC
pin 31	+17V		Power Supply +17V DC
pin 32	+9V		Power Supply +9V DC
pin 5/6/13/23		GND	GROUND

### Connector J6 (from controller)

pin 1	GND		GROUND
pin 2	R Insert	TTL	Input RED Text from Controller
pin 3	R Insert	TTL	Input GREEN Text from Controller
pin 4	R Insert	TTL	Input BLUE Text from Controller
pin 5	Insert	TTL	Input Insert from Controller
pin 6	HS INT	TTL	Input Hor. Sync Pulses from Controller
pin 7	VS INT	TTL	Input Vert. Sync Pulses from Controller

## Connections

### Connector J400 (to decoder)

pin 1	+17V		Output Power Supply +17V
pin 2	SC_2579		Output 3-level Sandcastle pulse from TDA2579
pin 3	+VID		Output Selection Voltage Video (+12V for Video)
pin 4	SDA	TTL	I <sup>2</sup> C bus
pin 5	SCL	TTL	I <sup>2</sup> C bus
pin 6/8	GND		GROUND
pin 9	VID/LUMA	TTL	Output Video/Luminance signal
pin 10	HUE	2..4V DC	Output control voltage Hue
pin 11	CHROMA	150Ω	Output CHROMA Signal
pin 12	+S VID		Output Selection Voltage S-Video (+12V for S-Video)

### Connector J401 (to decoder)

pin 1	(R-Y)	75Ω	Output (R-Y) to Line Doubler
pin 2	GND		GROUND
pin 3	Y	75Ω	Output Y to Line Doubler
pin 4	GND		GROUND
pin 5	(B-Y)	75Ω	Output (B-Y) to Line Doubler
pin 6	GND		GROUND
pin 7	SYNC	75Ω	Output SYNC to Line Doubler

### Connector J402 (from line doubler interface)

pin 1	(R-Y)	75Ω	Input (R-Y) from Line Doubler
pin 2	GND		GROUND
pin 3	Y	75Ω	Input Y from Line Doubler
pin 4	GND		GROUND
pin 5	(B-Y)	75Ω	Input (B-Y) from Line Doubler
pin 6	GND		GROUND
pin 7	SYNC	75Ω	Input SYNC from Line Doubler

### Connector J405 (from decoder)

pin 1	GND		GROUND
pin 2	(R-Y)_DEC	75Ω	Input (R-Y) from Decoder
pin 3	GND		GROUND
pin 4	Y_DEC	75Ω	Input Y from Decoder
pin 5	GND		GROUND
pin 6	(B-Y)_DEC	75Ω	Input (B-Y) from Decoder
pin 7	GND		GROUND

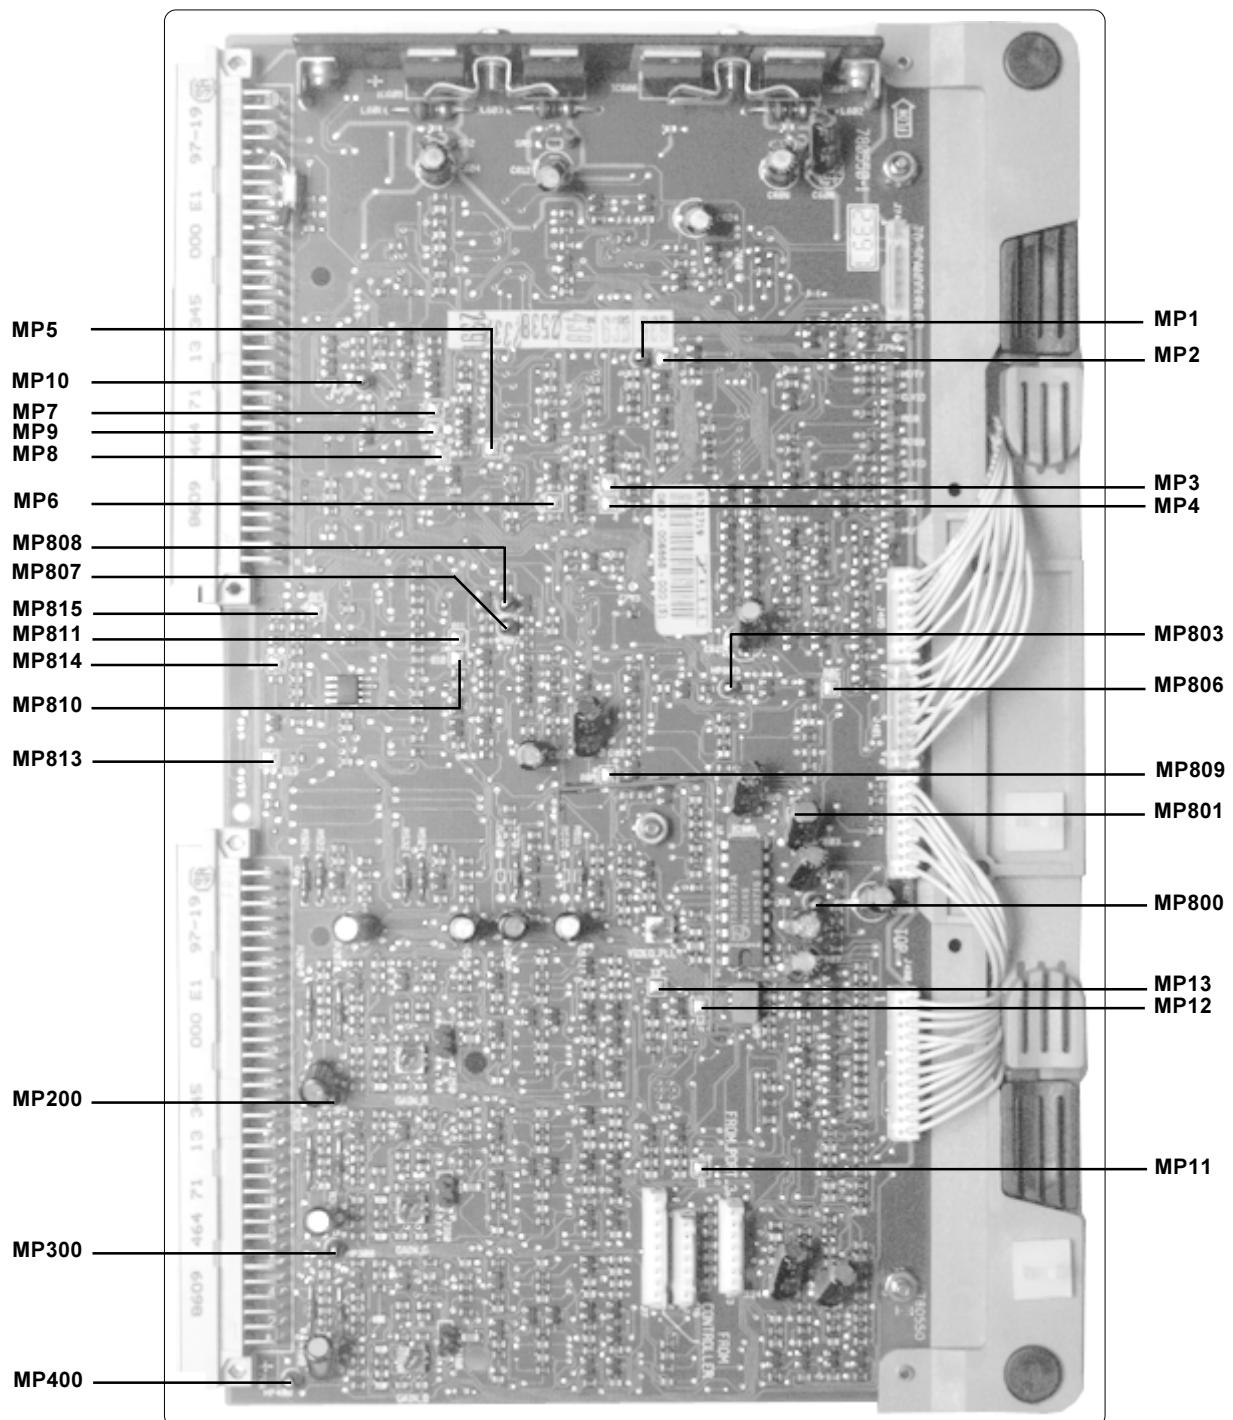

### Connector J741 (to line doubler interface)

pin 1	SDA		I <sup>2</sup> C bus
pin 2	SCL		I <sup>2</sup> C bus
pin 3	GND		GROUND
pin 4	+17V		Power Supply -17V ( $\pm 0.5V$ )
pin 5	-17V		Power Supply +17V ( $\pm 0.5V$ )
pin 6	+9V		Power Supply +9V ( $\pm 0.5V$ )
pin 7	GND		GROUND
pin 8	CP		Clamp Pulse

R762745

## CIRCUIT DESCRIPTION "DECODER + COMB FILTER" (R762745).

### General.

The decoder section of this board with comb filtering uses the decoder chips TDA4650 / TDA4665 / TDA 4565.

The implementation of the *adaptive digital comb filter* for PAL and NTSC 3.58 (not for SECAM and NTSC 4.43) has changed the input switching circuit and obviously two ICs for the digital comb filtering have been added. The first IC generates sync and sampling pulses. The second IC is performing the adaptive digital comb filtering. We'll concentrate mainly on this section in the next pages.

### Filter Switching

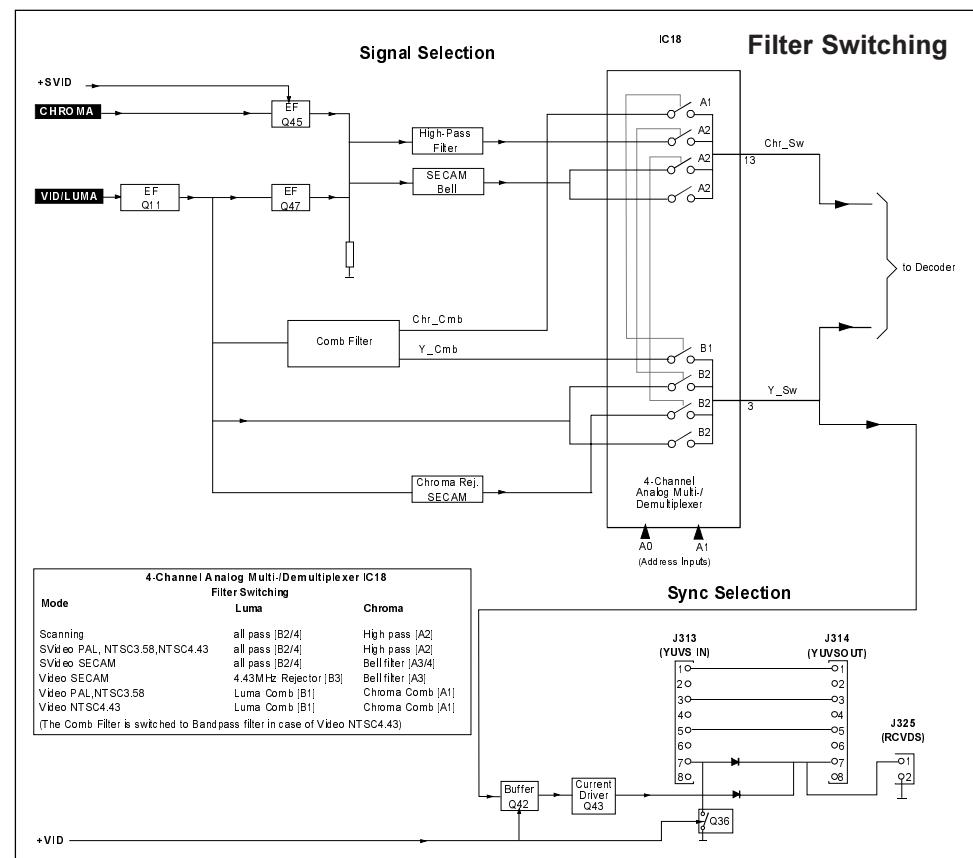

The decoder IC TDA4650 The VID/ LUM input signal is passing an emitter follower in order to supply the provided filters.

The multistandard Decoder chip IC 11 is checking sequentially the information on the backporch of the horizontal sync.

As soon the right system is identified, the appropriate output PAL/SECAM/NTSC4.43 or NTSC3.58 is put at a high level. The filters for the Luma signal are an all pass, a rejector around 4.43 MHz and a Luma Comb filter (via Q41). The filters for the Chroma signal are a high Pass 2.5MHz, a Chroma Comb filter (via Q40) and a SECAM BELL filter (via Q10).

The switching outputs of TDA4650 are supplied to a GAL (IC14), where the decoder mode will be recognized. The programmed GAL IC14 takes care, using the two outputs SwBit0 and SwBit1 as address inputs for the IC18, that the correct signal on the 4-channel Analog Multi-/Demultiplexer IC18 is switched through.

The filters are switched in the following way:

The two output signals of the 4-channel Analog Multi-/Demultiplexer IC18, respectively Chr\_Sw and Y\_Sw, are the supply signals for the Decoder IC's.

Next, the composite video is split into luminance and chrominance. This split depends on the colour system.

For PAL and NTSC 3.58 this is done by an adaptive digital comb filter. For SECAM this is done by passive filtering (like in the former decoder). For NTSC4 digital bandpass and band reject filters are used.

The chrominance is now applied to the decoder IC in order to furnish the colour difference signals -(R-Y) and -(B-Y).

These signals are then applied to the "baseband delay line" IC to add the chroma information of two subsequent lines.

However, when it is NTSC3.58 the digital comb filter has already done a similar action, this delay line IC is bypassed for NTSC3.58.

The CTI IC is supplied in any case with the colour difference signals and the luminance. The same CTI chip is also responsible for the luminance delay in order to correct the phase difference between the two signals amongst others due to the color decoding process.

Finally, the luminance passes a "sharpness control" and the three signals leave the decoder via current sources.

**Sync Processor CXA1686M.** The bloc schematic shows that the sync processor has three inputs : VID IN, C IN and Y IN.

There are two PLL's in the IC. The first one generates a stable **Burst Gate Pulse**. The second one generates a sampling frequency of  $4 \times F_{sc}$  (4 times the colour subcarrier) required by the digital comb filter IC.

Note that the colour subcarrier is 3.58Mhz in NTSC3 and 4.43Mhz in PAL. The required frequencies are consequently :

For NTSC :  $4 \times 3.58\text{Mhz} = 14.318\text{ Mhz}$  ( VCO1 in the bloc diagram)

For PAL :  $4 \times 4.43\text{Mhz} = 17.734\text{ Mhz}$  (VCO2 in the bloc diagram).

In order to generate these stable frequencies the second PLL is used. This PLL consists of an **APC** (Automatic Phase Control), a **VCO** (Voltage Controlled Oscillator) and a **divider** by 4 (1/4).

The APC receives the oscillator frequency divided by 4, and, the burst which must be gated out of the chrominance. Therefore, very stable burst gate pulses "**BGP**" are generated by the aid of the first PLL running at approximately  $32 \times F_h$  (32 times the line frequency) or approx. 500khz.

The BGP pulses, besides internal use in the sync processor itself, are also used by the comb filter (pin 17).

The reference frequency for the first PLL is provided by the ceramic filter KF100 connected at pin 5.

The videosignal first passes a "sync separator" which is further used in the IC itself to lock the first PLL (500khz).

Pin 10 accepts information concerning the colour system to the sync processor. The colour decoder IC 11 delivers this information. This pin is at a high level in NTSC3.58 and low level for PAL and NTSC4.43.

This switching voltage activates either the oscillator around XT11 ( $4 \times 3.58\text{Mhz} = 14.318\text{Mhz}$ ) in NTSC3.58 or the oscillator around XT10 ( $4 \times 4.43\text{Mhz} = 17.734\text{Mhz}$ ).

The videosignal from input 26 is amplified by 6db and via the pin 30 output capacitively coupled to the AD input pin 25 of the comb filter chip IC16.

The VID/LUMA undergoes a frequency limiting to 6Mhz with FI12 driven by Q49. This frequency limiting will avoid (sampling) alaising later in the AD and DA convertors of the Comb Filter IC16.

**Comb Filter CXD2024AQ.** The above IC can be supplied either with digital or analog signals. In our application the analog inputs and outputs are used. As pin 10 INSL is here at ground level for Video PAL, N3 and N4, we use (=activate) the analog inputs and outputs. For the other modes (see table 'Filter switching') pin 10 is at high level, setting the outputs at a DC level.

Anyhow, the processing for filtering the chrominance out of the luminance happens with digital circuits.

Therefore, the analog video is first converted to digital using the sampling clock generated in the sync processor.

It is worthwhile to note that the signal passing through this IC undergoes a delay of approximately 1 and 2 lines in NTSC and in PAL. This can cause synchronization and clamping problems if not taken care of. (see later : Input switching - synchronization).

The AYO (luminance) output at pin 31 passes through a low pass filter FI11 and is then buffered with Q41 to feed the 4-channel Analog Multi-/Demultiplexer IC18, pin 1 Y\_Comb.

This filter prevent the clock frequencies of the DA converter to pass through.

The ACO (Chrominance) output undergoes also a frequency limitation with the filter FI10 for the same reason, before supplying the pin 12 Chr\_Comb of the 4-channel Analog Multi-/Demultiplexer IC18.

The voltage at pin 21 determine the DC clamping level of the ADC.

The voltage at pin 41 (CVRF) is the gain of the chrominance output and pin 33 (YVRF) of the luminance output.

Pin 70 tells the IC whether the colour system is PAL or NTSC3.58; This determines amongst others the number of line delays for the adaptive digital filtering.

## Synchronisation.

The first selection of the sync signal is done in the source input selection. The result of this selection is the SYNC-EX which is available at pin 7 of the J313 connector.

### a) Video / S-Video :

When a video composite or S-Video source is selected the +VID voltage is high and the transistor Q42 gets forward biased just like Q43. Pin 7 of the connector J314 receives then the signal via these transistors. This signal has maybe undergone some delays depending on the standard.

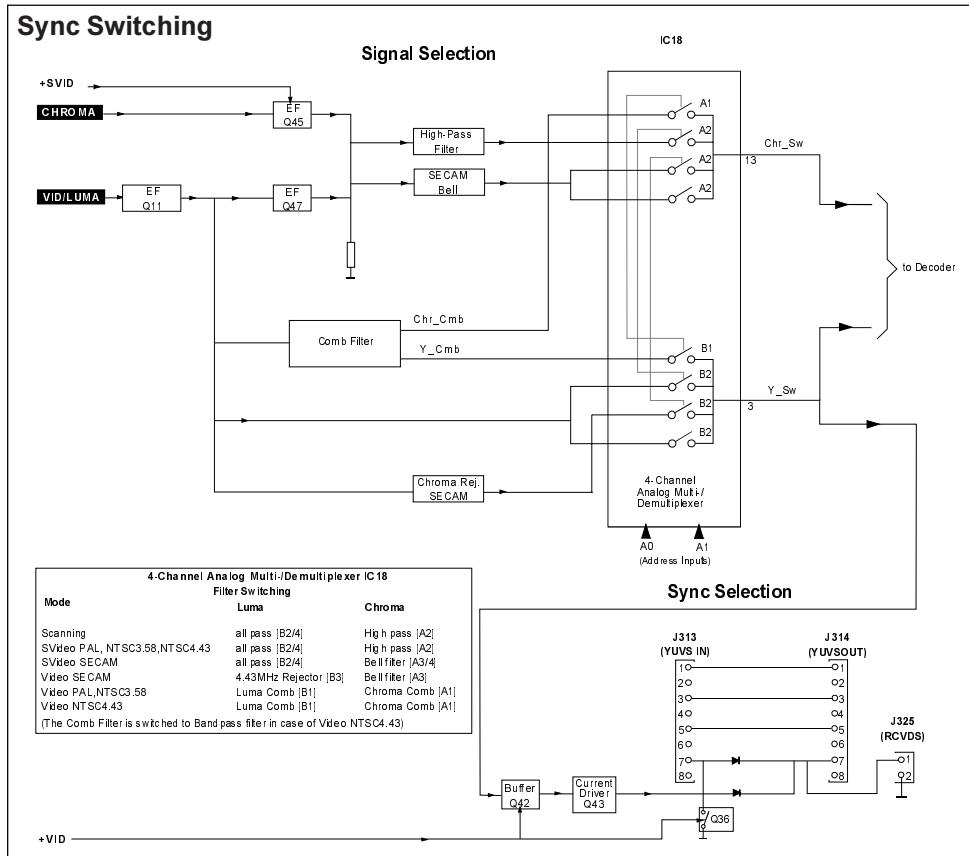

To ensure that the SYNC-EX does not get through, Q36 is saturated to short the SYNC-EX line to ground. The collector DC voltage of Q43 is blocked with D24.

# QUAD Decoder+Comb\_Filter

R762745

## b) RGB .

The selection of an RGB source simply means that the SYNC-EX signal is passed through D24 and feeds the SYNC board.

## Decoder - Sharpness.

We'll limit the discussion to the differences with the former version.

### a) Comb filtering in NTSC3.58

As for the NTSC3.58 comb filtering is done by the digital comb filter, the dual baseband CCD delay IC may be bypassed. This happens with Q13 - Q15 and Q12 - Q14 when NT3 is at a high level.

### b) Sharpness control.

In this version, sharpness is done with discrete components. A DAC TDA8444 provides the adjustable voltage: SHARPNESS.

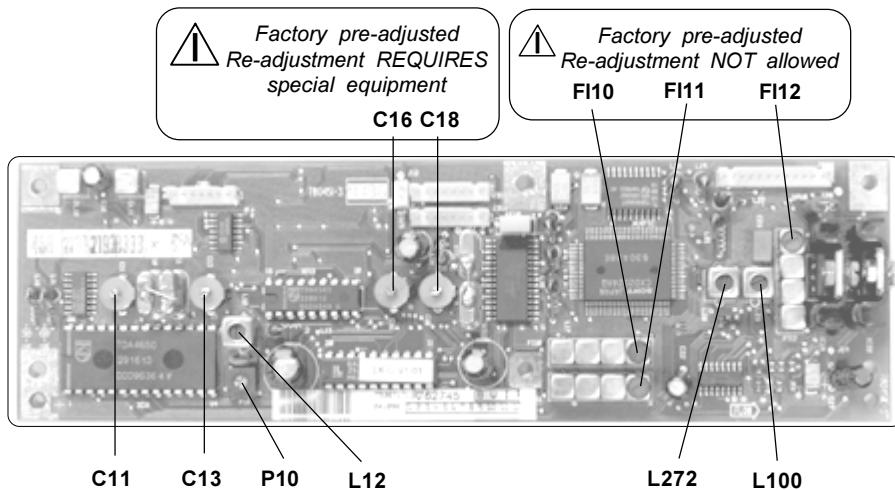

The sharpness control is based on the principle of combining two signals, one with a 'max negative' sharpness together with an amplitude adjusted sharpness signal.

The signal is delayed twice by means of two delay lines of 180ns. A combination of signals produce on the junction R62, R65 and R68 the max. neg. sharpness signal whereas on the junction R52, R55 and R61 the sharpness correction signal. The latter signal is amplitude adjusted in IC12 by the sharpness voltage. The two formed signals are combined on the junction R73/R78 and this signal is further used as Luma signal.

## ADJUSTMENT PROCEDURE QUAD DECODER R762745

### Location of controls

Measurement point 4Fsc

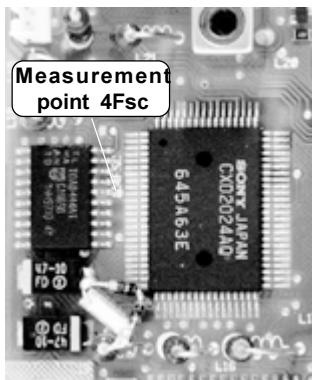

### A. Adjustment Comb Filter

#### 1. Quick adjustment for Color display

- Connect to the VIDEO input e.g. an electronic **PAL** color test video signal.
- Switch the projector in the VIDEO MODE. Select source 1.
- if there is no colour, adjust trimming capacitor C11 for color display.
- Connect to the VIDEO input e.g. an electronic **NTSC3.58** test video signal.
- if there is no colour, adjust trimming capacitor C13 for color display.

Final adjustment of the trimming capacitors C11 and C13 is explained in the 'adjustment of the decoder' (see further).

#### 2. Oscillator adjustments

- No input signal connected to the VID/LUMA and CHROMA inputs.
- Connect pin 28 of IC11 to L13 (forcing decoder into PAL mode).
- Connect a Frequency meter (Range 20MHz-accuracy of 10Hz) to the 4Fscline (pin 17 IC15).
- Adjust the trimming capacitor C18 for a frequency read out of 17.734476 MHz with an accuracy of 80Hz.
- Connect pin 26 of IC11 to L13 (forcing decoder into NTSC mode).
- Connect a Frequency meter (Range 20MHz-accuracy of 10Hz) to the 4Fscline (pin 17 IC15).
- Adjust the trimming capacitor C16 for a frequency read out of 14.318180 MHz with an accuracy of 80Hz.

## B. Adjustment Decoder

### 1. Reference Oscillator NTSC3.58

- Connect to the VIDEO input e.g. an electronic **NTSC3.58** test video signal.
- short circuit pin 17 of IC11 to ground.
- adjust trimming capacitor C13 for a colour zero beat.
- remove the short-circuit.

### 2. Reference Oscillator PAL

- Connect to the VIDEO input e.g. an electronic **PAL** test video signal.
- short circuit pin 17 of IC11 to ground.
- adjust trimming capacitor C11 for a colour zero beat.
- remove the short-circuit.

### 3. Chroma rejector Secam L20

- Connect to the VIDEO input e.g. an electronic **SECAM** test video signal.
- connect an oscilloscope to the capacitor C22.
- adjust the core of coil L20 for a minimum of chroma in the video signal.

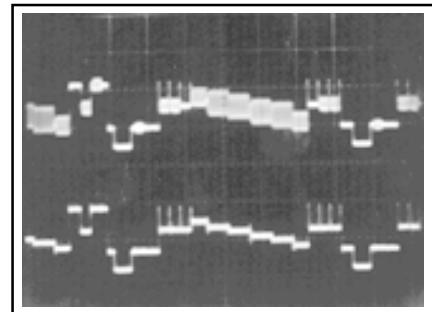

Foto 1  
Alignment chroma rejector L20  
Upper track: viewed video line  
Lower track: Y signal

- Connect to the VIDEO input e.g. an electronic **SECAM** test video signal.
- connect an oscilloscope to the provided **Measurement point C** (Chr\_Sw pin 15 IC11).
- adjust L23 for a flat amplitude of the signal during two successive lines.

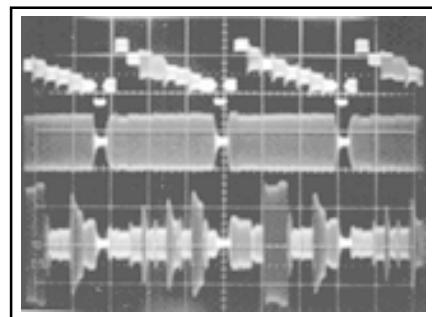

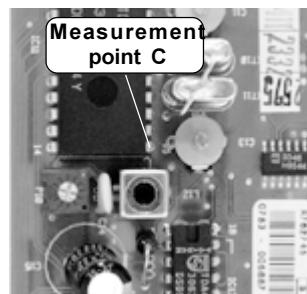

Foto 5  
BELLFILTER L23  
Upper track: viewed video line  
Lower track:  
1: correct setting  
2: incorrect setting

## 5. Secam Reference circuit (L12 - P10) (photo 3 & 4)

- Connect to the VIDEO input e.g. an electronic **SECAM** test video signal.
- connect the oscilloscope to the coil L11 (B-Y).
- adjust L12 so that the level of the (B-Y) signal without colour information is the same as the level during blanking.
- connect the oscilloscope to the coil L10 (R-Y).
- adjust P10 so that the level of the (R-Y) signal without colour information is the same as the level during blanking.
- If necessary the level in (B-Y) channel has to readjust to zero with the coil L12.

## TECHNICAL DESCRIPTION SECOND RGB INPUT 7621055

### Introduction.

With this board a second RGB analog input can be selected through the D9 (former TTL input) connector next to the first input . Since this board occupies the former TTL connector, the sync polarity must be corrected automatically and the board must also select automatically between "Sync on Green" and "Separate Sync".

In case of a separate sync input HS the sync width pulse is also set to 1/13th of the line period.

The R, G and B output signals are sent to the "RGB INPUT + SW " module. The sync outputs VS OUT (if any) and / or the HS / Comp Sync are sent to the VERT DEFL board for further processing.

### Red, Green and Blue Inputs.

Three identical differential amplifiers are switched to "active" with the ON voltage. This ON voltage is obtained from the +PORT 3 voltage arriving at contact 28 (=former +TTL voltage) and the transistors Q50 and Q53. Note that the 75 Ohm termination is not switchable.

The **Red** signal is taken from the collector of Q2 and fed to the current driver Q4. The collector resistor of the latter is on the RGB SW + Input board. G OUT and B OUT are got in a similar way.

The green signal is also sent to Q60 and used for synchronisation if "Sync on Green" has been detected (see further).

The blue output at Q23 is also supplying Q15. When the Blue in Green switch S2 is in a closed position, Q16 is blocked and Q15 adds some amount of blue into the green channel via D25 . If however S2 is open Q16 is saturated and Q15 does not get enough base voltage and is consequently blocked.

Note : The "Blue in Green" of the first analog input is switchable via the remote control, thus via software control. Here, the blue in green is switched with S2 and is not affected by the software.

### Vertical Sync Input - Automatic Polarity.

If separate vertical sync pulses are available and applied to the Q41 / Q43 input they arrive on the Q39 amplifier/inverter. The inverted pulses are now inverted or not inverted depending on the voltage level of pin 12.

Assume the pulses at the drain are positive. Then Q46 is regularly switched on by these pulses and the average voltage at the collector or at pin 12 is low. In such case the output pin 11 follows the input pin 13 , which means that the pulses are positive at pin 11.

If the pulses are of a negative polarity at the drain, Q39 never gets in conduction and the level at pin 12 is "high" through R127. The input pulses are inverted by the exclusive OR gate.

The polarity of the pulses at pin 11 is thus always positive irrelevant of the input polarity. These pulses are proceeding to the base of Q47 via D54 and to the multiplexer / demultiplexer 4053B, pin 11. The +RGBS voltage provides the necessary biasing for Q47.

The 4053B is triple two-channel multiplexer, having three separate digital control inputs. One of these control inputs is pin 11.

If VS pulses are applied to the input, then the HS/CS output must be the HS input. The selection between HS or CS happens in the second multiplexer. On other words, as soon VS pulses are applied, the HS pulses must also be selected.

The presence of the VS pulses determine the correct voltage at pin 9 in order to select the pin 3 input (Shaped Horizontal Sync).

**Horizontal Sync/Composite** The HS / CS signal, taken from the collector of Q32 , is passing a similar automatic **Sync.** polarity circuit as the VS pulses.

When no pulses at all are applied to this circuit, the monoflop IC3 is never re-triggered and the output remains all the time "low". This output is filtered and is the control voltage of the multiplexer.

The "0" output is then connected to pin 15 which is at ground level. This all means that Q58 is saturated and the **+RGsB** voltage becomes available for further switching. The LED D50 comes on to indicate the RGsB mode.

When the monoflop is constantly triggered with pulses the output is switched "high" and then the "1" output of the multiplexer is connected to the grounded input (pin 15). This now provides the **+RGBS** voltage instead.

When no VS pulses are available, the "0" input pin 5 of the multiplexer is chosen. The "1/13 DUTY-CYCLE Control System" circuit cannot be used in this case due to the presence of the VS pulses in the composite sync.

## 1/13 Duty-Cycle Control System.

When separate HS pulses are used for synchronisation, the width of the pulses is all the time adjusted to 1/13th of the line period.

Positive horizontal pulses are applied to the leading edge input pin 12.

The output pulses are integrated by R177/C87 and applied to the non-inverting input pin 3 of the (Miller-integrating) OPAMP IC4. The other input is installed at a voltage set by R180/R178 ( 6 volts).

This integrated voltage is proportional with the width of the pulses and inversely proportional with the line period. The output of the Miller-integrator (=OPAMP) determines the current flowing in Q63.

This all means that the width of the sync pulse depends on the line period and the feedback systems provides a setting to 1/13th of the line period.

These SHAPED HORIZONTAL SYNC pulses proceed now to the multiplexer and if VS is available, these pulses are selected and Q48 brings them to the output.

J4\*: interconnection with the optional BCL Linking module

J5\*: interconnection with the optional Soft Edge module

## Power Supply

## Technical description of the R-G-B driver R762720

### Introduction

The RGB Driver module contains the following parts:

- Red Video driver channel
- Green Video driver channel
- Blue Video driver channel
- Generation of support signals

### General.

The black level of the Red, Green and Blue signals have been clamped at zero volt and the amplitude adjusted to 0.7V on the Input board. The signal is now ready to undergo the Brightness and Contrast controls before reaching the video power amplifiers. The optional contrast modulation can also be added to the contrast voltages if implemented.

Furthermore, as a colour temperature adjustment is also possible, the gain and black levels are controllable per colour and tracked in some way to maintain the colour temperature over the full range.

The red, green and blue colours are passing through identical circuits, but, as a gamma correction is implemented, the red and blue channels are a bit different from the green (master) channel. We'll discuss first the green channel and limit the discussion of the red and blue to the differences with the green.

### Green video channel.

#### a) Contrast / Green Gain / Contrast Modulation.

The videosignal is terminated at 50 Ohm with R300 (coax cable is 50 Ohm), clamped at 0V and has an amplitude of 0.7V on the input board. IC301 is an analog multiplier and its output  $W = (X_1 - X_2) \times (Y_1 - Y_2) + Z$ .

The videosignal at pin Y1 is thus multiplied with the voltage at pin X1, since X2 and Y2 are both at zero level.

The Z input is at this moment connected to ground level, consequently, the black level at the output is also 0V.

The GAIN\_GREEN voltage changes from 0.05V ---> 1.2V. This voltage is the result of the general contrast, the individual gain adjustment of the green channel and the contrast modulation board. IC304 (HF A100) amplifies this signal 5.7 times.

#### b) Brightness / Black level offset controls.

The positive bias voltage obtained by R319/R317 installs a negative black level output in order to use the full output swing of this amplifier. This black level is then again pulled up with R324 and the current generator Q300. C317 means a bypass for the video frequencies.

Via Q301 and R329 the green video is applied to the base of Q302. The latter is, together with Q303/Q304, an non-inverting amplifier with a low impedance drive output, necessary to match the 75 Ohm cable impedance realising the connection with the video output amplifier.

The required biasing current is obtained with R337, which determines together with R340 the gain of this amplifier.

The output signal G\_OUT and the current from the DC\_GREEN voltage (= black level offset voltage) is compared with the reference of +2V in IC305(2,3,6) during the CP pulse time window.

If, for example, the output voltage is too high, the output of the comparator increases and the current generator Q300 draws less current through R324. The voltage drop across this resistor decreases and compensates the too high DC output level.

## c) Peaking adjustment.

By adding an overshoot and undershoot to the video transitions, the picture looks sharper. If these over/undershoots are adjustable in amplitude and width, we can adjust an overshoot matching the bandwidth and the scanning frequency of the signal. If for example the *PEAKING\_1* line is high, there is a current flowing in R330/D303/R331 towards the emitter of Q302. The RLC circuit L33/C319/R331 is then in parallel across the emitter resistor. A critically damped sinus peak is seen at the output. *PEAKING\_1* gives the smallest peak and must be selected for the highest scanning frequencies.

Three selections are possible related to the scanning frequencies : low / mid and high range.

If no peaking is wanted, R336 means a compensation, in order not to change the gain of this stage.

## d) Spot killer.

During operation, the gate of Q301 is at +12V and the latter is fully conducting (5 Ohm resistance). At switching off the projector, the *SPOT\_KILL* line is dropped very quickly to 0V and Q301 is immediately blocked. This avoids any undesired voltage peaks that could cause a spot on the CRT.

## Red video channel.

The in- and output circuits are identical to the green channel. In between the contrast adjustment and the x 5.7 amplifier, a gamma correction network is incorporated. This gamma correction is based on the red CRT characteristic which is different from the green one.

The relation light output / drive voltage for the red CRT is more linear for the red CRT phosphor than for the green phosphor.

With IC202/IC203 a non-linear correction in the mid-grey zones is now possible.

The (original) video signal is applied to the X1 (pin 8) input of the multiplier IC203. Pin 7 (X2) is fixed at 0.7V with R212/R214.

The same videosignal is, on the other hand, sent through a step attenuator. By switching on one of the switchers of IC202 the video signal is divided with R204, R206, R208, R210 and the common R213. With the *MIDLIGHTS\_1, 2, 3, 4* lines one can select between 15 possible steps. The attenuated signal is then applied to the Y2 input whereas the Y1 is at 0V.

The output W, pin 5, is  $(X1-X2) \times (Y1-Y2)$ .

Assume the input is a linear ramp from 0 -100% or from 0 - 0.7V. The output of the multiplier is then a positive parabola with a maximum at 50% of the ramp and zero at 0 and 100% of the ramp. The amplitude of this parabola is determined by the step attenuator. This parabola is sent to the inverting input of IC204 via R217 and subtracted from the original ramp.

As a result, we obtain a new non-linear ramp where the 50% zone has a decreased amplitude and the 0 and 100% zones are not affected. With this step attenuator, the light output / drive voltage of the red CRT tube can be adjusted to match the green one.

## Blue video channel.

### a) Gamma correction.

The light output / drive voltage of the blue CRT is less linear than the green one. We can obtain a matching when the polarity of the parabola is inverted compared to the red

one. This is got by swapping the Y1 and Y2 inputs of the multiplier IC403. If we assume again a linear ramp input, the parabola of the output W of IC403 is negative. The final result at output pin 6 of IC404 is a non-linear ramp with an increased amplitude in the grey zones.

## b) Blue correction circuit.

The blue phosphor saturates from some drive voltage onwards. This saturation point depends on the CRT phosphor, the spot size, frequency of scanning, temperature, etc...

To resolve this problem, the blue signal undergoes an increased gain from some level onwards (the breakpoint level).

This level can be adjusted by software and is the *BLUE\_BRKPNT* voltage. As soon the emitter voltage of Q402 exceeds the *BLUE\_BRKPNT* level with 0.3V diode voltage drop), the diode D412 gets forward biased and R456 is added to the emitter load. The slope of the correction is further adjusted by means of the *BLUE\_CORR 1,2,3* voltages. This will add to the emitter load one of the feedback resistor(s) R454, R455, R456 or a combination of these.

## c) DC stabilisation, additional clamping.

Without further measures, the DC level of the emitter voltage would not be very stable. It is very much temperature dependent and it varies with the bias current through the stage. An additional clamping is required.

This clamper compares the output voltage with the emitter voltage during the *CP* timing window. The output voltage drives Q407 which is part of the biasing resistor (drain connected to -12V).

Q408 provides a lower impedance for the source of Q407, as the current flow through R437 and Q407 depends also on the video signal.

## Blanking.

The composite blanking pulses are the result of the sum of different individual blanking informations added together in the NAND IC104 after modelling to the correct TTL amplitude.

If there is no blanking necessary, the output pin 8 of the NAND is low level and this forward biases Q107 and Q109. The current flowing through the latter installs around +11V at the *BL* output.

In case of blanking, the TTL high level output of IC104 forward biases Q108 now and through Q110 the BL output is at around -16V.

D114 - D117 avoid saturation of the transistors and hence improve the switching.  
Following blanking informations are an input to the NAND gate IC104 :

### - *LP* (line pulses) :

are dropped in amplitude with R116/R117/R140 limited with D102/D103, inverted by IC103 (5,6) and input to pin 1.

(note : the same negative line pulses are inverted again with IC103(1,2) and then referred to as *HFB* to be used in the optional Contrast modulation board.

### - *V BL* (Vertical Blanking) :

these pulses are also dropped to TTL level, inverted and applied to pin 2.

### - *SPOT\_KILL* ( pin 5 ) :

The line SPOT\_KILL is +12V during operation and drops to zero level at switching off the projector to blank the picture.

## - SCAN FAIL (pin 6):

This line is high when there is no scan fail and drops to zero when scan fail has been detected.

(note : The scan fail condition also drops the SPOT\_KILL line to an active low level and hence switches off the video output stages of the UN DRIVE board.

## - Supply voltages controls (pin 3,4) :

The +/- 12V and +/-5V supply voltages are checked with the window detector IC105. If one voltage fails or is not within the desired window, the output switches low and the same pins 3, 4 are pulled low level. Note that this will mean a scan fail condition and the SPOT\_KILL line will be active as well.

## - LEFT/RIGHT blanking :

The blanking pulses for the beginning of the scan (left blanking) are generated by IC108 (output 4) by triggering the monoflop on the positive transition of the *LP* pulses. The output pulse train of pin 13 is integrated with R138/C108 and compared with the *LEFT\_BLANKING* voltage. The output of the Miller integrator drives the current source Q104 which determines the pulse width of the blanking pulses.

The pulses for the end of the scan are generated by the other monoflop in IC108. Here, the monoflop is triggered by the negative transition and the positive pulses at pin 5 output are used. Consequently, the low level of these pulses is the blanking time. It is obvious that, in this case, the negative pulses at pin 12 are integrated and the obtained voltage is used to adapt the pulse width in conjunction with the *RIGHT\_BLANKING* voltage.

The integration of the pulses (average voltage) means a tracking of the range with the line frequency. The absolute value of the required blanking is much smaller for the higher scanning than for the lower scanning signals.

Another tracking is also got by a correction current via D122 and D124 by switching on Q111 with *HFB* pulses.

## I<sup>2</sup>C Interfacing.

**IC100** : the *MIDLIGHTS\_RED* and *\_BLUE* switching on/off voltages.

**IC101** : 3 outputs are the *PEAKING* adjustments.

If no peaking is needed, the three outputs are at approx. -11V and hence Q112 and Q113 are both conducting. The output *NO\_PEAKING* is then at about +12V.

As soon one output of a comparator switches to a positive high, due to the resistive dividers R171/R172/R173, the emitter of Q112 jumps at -3.5V and the latter gets blocked. The *NO\_PEAKING* line is then at about -5V and D123 is forward biased to keep the impedance of the *NO\_PEAKING* line low and avoid distortions in the RGB DRIVE stages.

IC100 uses the same address of IC601 on the INPUT board. The data line SDA of either one of these I<sup>2</sup>C interfaces can be disconnected via a switching Mosfet. To select this IC100, output port P7 of IC101 must be low level, blocking Q103 and via R113, Q102 is forward biased.

## **IC109** :

two outputs are used for the Left/Right blankings and VO3 is the Blue breakpoint output. The DC range is corrected with IC102 (8, 9, 10).

## 7. Spot suppression

There are two actions at switching off the projector :

- via the **G1 grid** :

The G1 grid voltage is at approximately 0V via D101. During normal operation and on condition the +17V is correct (sufficiently high) Q100 is saturated and Q101 is off as its base is lower than 0.6V. The collector of Q101 is then at 150V or the voltage drop across Z101. C100 is consequently charged up to 150V.

At switching off, the +17V drops very quickly to zero and the +210V rather decays slowly. The moment Q100 shuts off and Q101 gets forward biased, the collector of the latter drops to zero and the - of the capacitor C100 drops also instantly with the same amplitude to -150V. The G1's are dropped to -150V and the CRT's are blanked.

- via the **cathodes** (drive voltage) :

The SPOT\_KILL line is in normal operation at +12V via R106. When the projector is switched off, the line is dropped to 0V via D100. This zero level cuts the output via the mosfets Q201, Q301, Q401.

## Contrast, brightness and gain adjustments

### Contrast / Gain.

The general (common) contrast and the individual gain controls are first combined with the (optional) contrast modulation waveforms and as such used in a multiplier (a variable gain amplifier) to adjust the amplitudes.

The contrast voltage is generated by the IC3 VO0 output and ranges from +1V (minimum) to +3V (maximum). The multiplier requires just the opposite, hence, the contrast voltage is inverted by IC5 (8,9,10). R54 and D8 avoid this contrast voltage from exceeding the +3V as this would mean that the multiplier inverts the polarity of the videosignal. This contrast voltage is now three time multiplied with the gain control of each colour. This is realised by using the contrast voltage as the VRP3, VRP2 and VRP1 supply for the potentiometers 1, 2 and 3 of the Bella IC3 and the other end of the potentiometers (VRN\*) is connected to the +3V, or the minimum contrast.

The outputs VO1,2,3 are thus the result of the general contrast and the individual gain controls.

The output range of the Bella's is not what is needed by the multipliers. Therefor the OPAMP's / inverters in IC4 adapt the range to 0.05V <--> 1.19V which is the needed range of the multipliers.

### BCL / IBCL / Drive modes.

The contrast voltage can be reduced by the *BCL* and *IBCL* informations. The negative *BCL* voltage from the EHT board drives Q2 on from the -0.6V level onwards and this will turn on Q1. The *INTernal CONTRAST* voltage or the *BCL\_LINK* voltage cannot further increase in this case.

The *IBCL* voltages are slightly smoothed and compared to an adjustable voltage (*IBCL\_VALUE*) from the potentiometer "0" of IC2. This value depends on the Eco / Normal / Boost mode drive, set by software.

As soon an *IBCL\_\** voltage reaches the *IBCL\_VALUE* the corresponding comparator drops the contrast through one or more of the conducting diodes D4, D5, D6.

### ABL trigger generator.

The ABL circuits of the RGB video amplifiers are triggered by a pulse of 20 µS and an

amplitude of 12V. This pulse is added to the *IBCL* lines as these lines are not carrying any valid information during this time. The *ABL* pulse is here ac coupled to the lines through C19, C20 and C21.

As the *ABL* trigger pulse is generated on the *UN SYNC+ VERT DEFL* board and superposed on the *V BL* (has an amplitude from 17V - 34V), the *V BL* is dropped by 20V with Z3 and Q3 will conduct during this *V BL* pulse time.

The differentiator C18/R70 drives Q4 into conduction for 20 $\mu$ s and via R73/C19, C20, C21 they are AC coupled into the *IBCL* lines.

### Brightness / Black Level.

#### Introduction.

The brightness control is about identical to the contrast. The general brightness is combined with the individual *BLACK\_LEVEL\_\** and the resulting *OUTPUT\_DC\_\** voltage is an offset of the reference black level of +2V.

At 50% brightness setting, the black level of the output signal of the *RGB DRIVE* board must be clamped at +2V. This condition is translated into a 2V output for the potentiometers VO1, VO2, VO3 of IC1 **and** IC2. Only then, there is no current flow in R7, R8, R9, R10, R11 and R12. The +2V *OUTPUT\_DC* is now the same as the reference voltage of the inverters/sommators (=comparators) IC205, IC305, IC405.

#### Circuit Implementation.

As *VRN0* = +3V and *VRP0* = +1V the brightness voltage at VO0 of IC1 changes from +3V (min. brightness) to +1V(max. brightness). This brightness voltage is applied again to the *VRP1,2,3* of three potentiometers in IC1. The other end *VRN1,2,3* of these potentiometers is the reference voltage **+2V**.

These three potentiometers in IC1 obtain the same settings of the gain controls in IC3. If now the brightness voltage is +2V (50%) the outputs VO1,2,3 of IC1 are ALWAYS at +2V, irrelevant the gain setting.

Any change of the brightness and gain settings change the output voltage(s). With above "**gain scaled brightness voltages**" the black level is tracked with the gain adjustment in order not to deteriorate the colour temperature with contrast.

We can however add to these "gain scaled brightness voltages" an extra offset via R10, R11, R12 to adjust the low lights.

## Interconnections

### Connector J1

Pin naming	Pin NR	In/Output	Description	Signal specifications
VIDEO_IN	2	IN	Video input signal from RGB driver	Black:2V Video: 4Vpp
IBCL	3	OUT	IBCL info to driver	0.7V DC
		IN	ABL trigger Pulse (AC coupled)	12Vpp/20us
BL	5	IN	Composite Blanking pulses	12V: no Blanking -17V: Blanking
+12V	6		Power Voltage +12V	+12V DC
-9V	7		Power Voltage -9V	-9V DC
+210V	9		Power Voltage +210V	+210VDC

### Connector J2

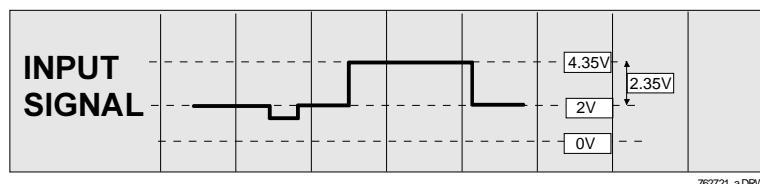

Pin naming	Pin NR	In/Output	Description	Signal specifications
-FIL	2	IN	Heater voltage floating on the 100V	6.3V
+FIL	3	IN	Heater voltage floating on the 100V	6.3V
G1	4	IN	G1 Voltage	+0.7V normal -150V when power down
G2	6		G2 Voltage	+500...1000VDC

## Adjustment procedure

### Preparation

Supply an external signal to the projector (e.g. a color bar signal)

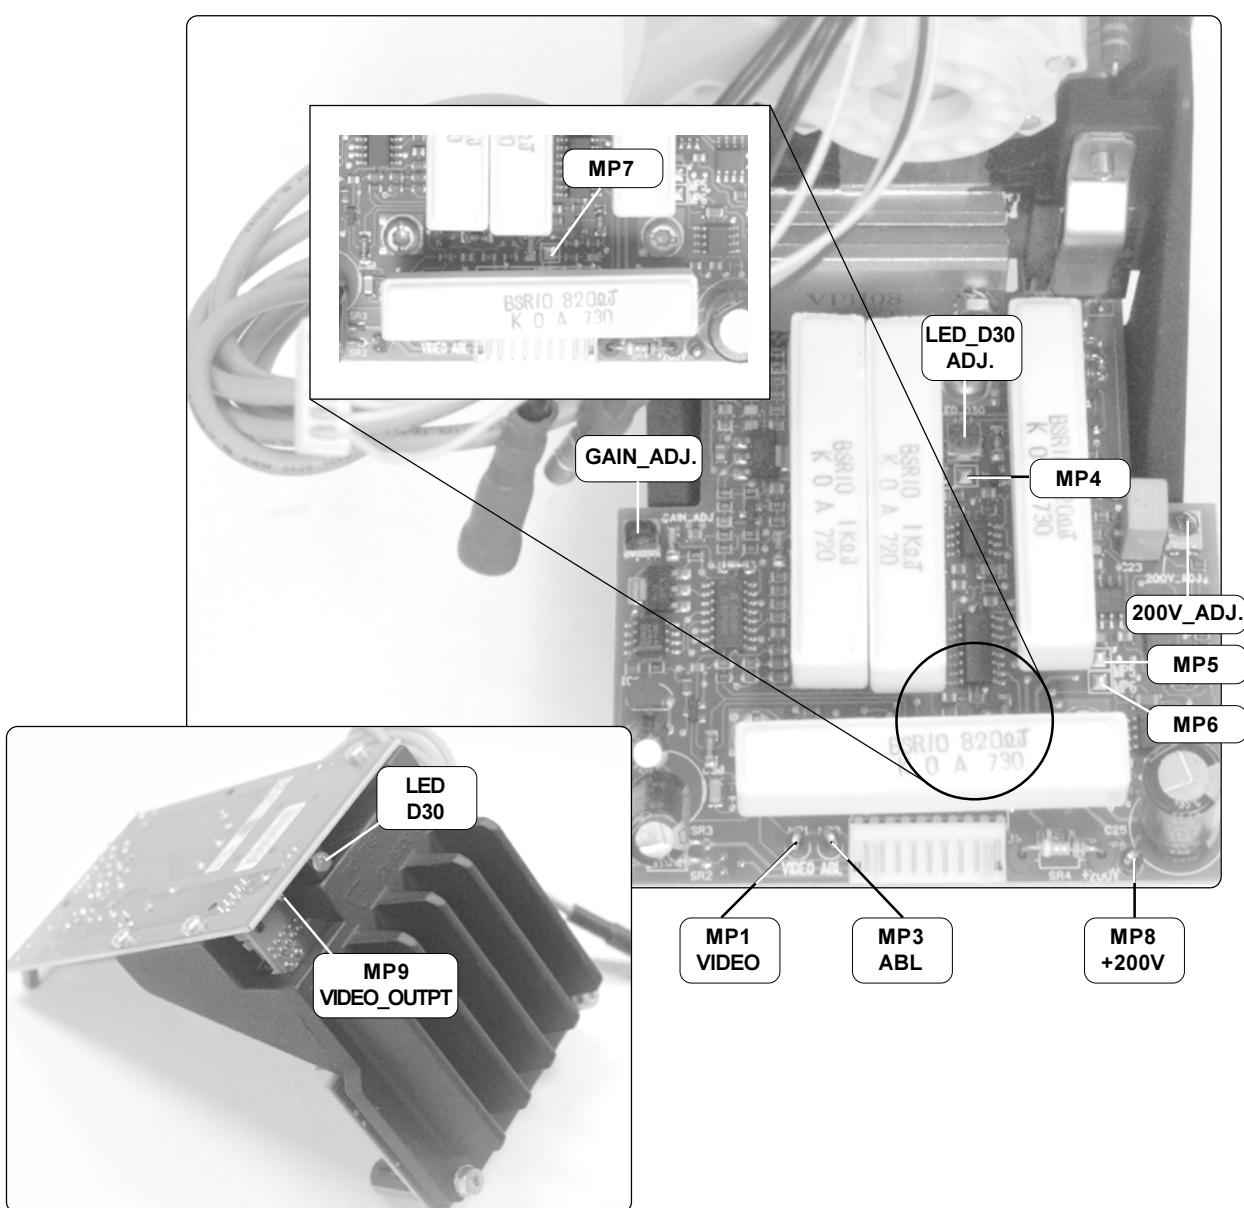

Connect the first measuring probe to the video input signal, testpoint TP1 'VIDEO\_IN'.

Adjust the projector brightness control until the DC blacklevel of the video input signal reaches 2V.

### Location of controls

Adjust the contrast control until the video input signal information reaches an amplitude of 2.35V.

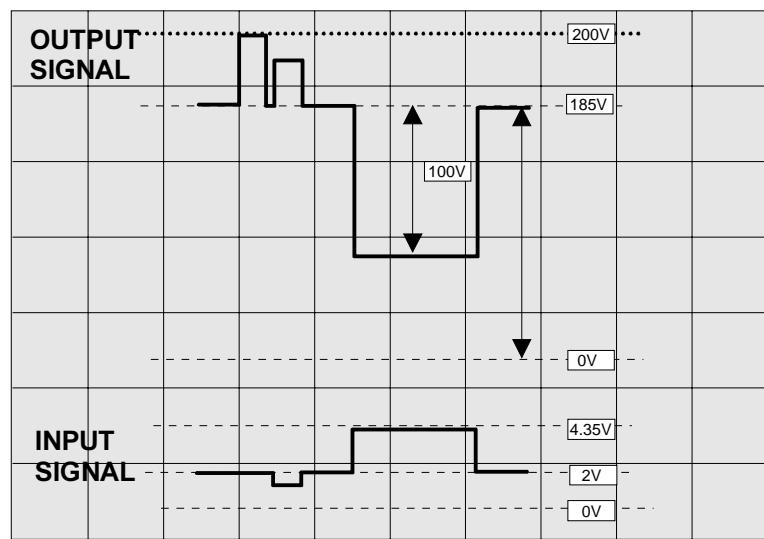

## Adjustments

### Adjustment of the +200V (Regulated Power Supply)

- Connect a voltmeter to the measurement Eye contact MP8.
- Adjust the potentiometer P3 for +200V on MP8.

### Adjustment of the signal GAIN for each output Amplifier

- Connect the oscilloscope probe to the measurement Eye contact MP9 'VIDEO OUT'
- Adjust the potentiometer P1 for an amplitude of the output signal of 100Vpp

284.dsf

UPPER TRACK:  
e.g. Green output signal

LOWER TRACK:  
e.g. Green input signal

### Adjustment of the ABL\_LED

IMPORTANT: No oscilloscope probe connected to the Eye contact of the respective picture tube.

Adjust the potentiometer P30 until the LED D30 'ABL\_LED' just stops lighting up.

## Technical description Video Amplifier R762839

### Video Amplifier

The video signal arrives at pin 2 of J1 and is terminated into  $75\Omega$  by the resistors R1...6. The first half of IC2 switches the base of Q2 between this video signal (no ABL-Automatic Black Level) and the reference voltage on pin 1 of IC10 (during ABL).

Via buffer Q1 and D3, the signal is fed to the input of a non-inverting amplifier formed by Q2 and Q3. The diode D3 serves as protection for Q1 against high inverse V<sub>be</sub> voltage during blanking. The resistors R13, R14 form together with R15 and R104 a divider that is chosen to limit the voltage at the emitter of the transistor Q1 during overdrive conditions of the input. This prevents saturation of the amplifier.

The amplified signal arrives at pin 4 of the VPH08. Feedback for the previous amplifier is taken from pin 3 of the VPH08. The potentiometer P1 determines the GAIN and C1/R21 improve the frequency response.

IC1 (VPH08) is a cascode class A amplifier with built in buffer stage and external load resistor, formed by R32...35.

Via pin 2 of J3 and J4, the signal goes to the IBCL (Individual Beam Current Limiting) and ABL measurements stages and finally arrives at the cathode of the CRT. The components D4..D7,C49, R103, D28, B1, B2 and R95 protect the amplifier against arcing.

### IBCL measurement

With the transistor Q4, the mean cathode current is measured. The current flows via D12, D13 and Q5 and through Q4 to R45. There, the current is converted into a voltage and is sent to the RGB driver module. The capacitor C10 prevents high frequency currents to flow through Q4. The resistor R46 and zener Z4 form a protection network.

### ABL measurement+ Switch

During the non-ABL period, the base-emitter junction of the transistor Q6 is shorted by the transistor Q5. The cathode current flows through R51 and Q5 to the IBCL measurement stage. If the cathode current is high, the voltage drop across the resistor R51 increases and D12/D13 also come into conduction. The gate of Q5 is held at +5.6V with Z1 and R49/R50.

During the ABL interval, the optocoupler IC7 comes into conduction and shorts the gate-source of Q5. Now the cathode current can flow through the transistor Q6, R52 and R53 to the ABL control loop. By shorting the transistor Q6 outside the ABL interval, smearing is prevented.

The optocoupler is controlled by the circuit around the transistors Q10 and Q11. During the blanking, the BL-signal (Blanking) is negative (-15V). The pulse is integrated by R80/C22. During the blanking, the BL-signal is wide enough to get Q10, Q11 and IC7 into conduction until some time after the vertical blanking.

### ABL Control Loop

This circuit has to keep the cathode current just above the black level constant. The ABL measurement is performed at the end of the vertical flyback, when the electron beam is moved outside the phosphor screen of the CRT in order not to see these measurements lines.

The ABL interval is initiated by a 12V pulse of 20 $\mu$ s, which is AC coupled on the IBCL line. The pulse is coupled via R54 and C13 to the base of Q7. The resistor R55 keeps the diode D15 into conduction if there is no pulse to prevent false triggering. The pulse at the emitter of Q7 and MP7 is used to perform the leakage current measurement and is now called leakage pulse. With the trailing edge of this pulse, the transistor Q8 starts to conduct through the network C14, R59 and R60 for about 20 $\mu$ s. This pulse at MP6 is now called the measurement pulse. The total ABL interval is 40 $\mu$ s wide and is electrically formed by D17, D18 on R61 and C15.

This pulse is used to inhibit the blanking and to switch Q1 to the reference voltage. This voltage is formed by R78 and R79 during the measurement pulse and is then +2.4V.

During the leakage measurement is transistor Q16 in conduction and lowers this reference with R101 to +2.0V. IC10 buffers this voltage and can sink the base current of Q1.

The leakage current enters the control loop through pin 10 of J3/J4 and is converted to a voltage with R71. This voltage is first amplified with IC9 pins 1, 2 and 3 with a factor 90. The diodes D22 and D23 limit the input levels.

During the leakage measurement the emitter of the transistor Q7 is high and pins 1, 10 of the switch IC4 are closed. The amplified voltage comes on C18 and is compared with ground by IC9, pins 5, 6 and 7 which adjusts the bottom of R71 until steady state. This system compensates for leakage currents that might flow out of the cathode.

During the measurement pulse is the level at MP6 high and the switch IC4 pin 3, 4 and 9 is closed. The input reference is now 2.4V at the base of the transistor Q1 and this should give a cathode current of about 20 $\mu$ s.

The amplified voltage that corresponds to this current comes on capacitor C19 and is buffered by IC3 pin 5, 6 and 7. The voltage is compared by IC3 pin 1, 2 and 3 with a reference and adjusts the output DC level at the collector of Q3 trough R30.

During the leakage measurement the input voltage at Q1 is equal to 2V, and the output voltage should be 185V. This voltage is divided with R68, R69, R70 and P30 to 0V. This voltage is buffered by IC6 pins 5, 6, 7, and compared by the comparators IC5 with 2 references. The potentiometer P30 is aligned so that the LED D30 is turned off at an output black level of +185V. The G2 potentiometers can then easily be adjusted (if the LED D30 turns off, the G2 is at the correct level because the cathode is at 185V black level).

## Regulated Power Supply

The Power Supply had to be regulated to guarantee the performance of the VPH08 and to eliminate variations on the +210V Power Supply. The +200V is divided by R90, R91, R92 and P3 to 0V and compared with ground by IC6 pins 1, 2 and 3. If the output voltage is too low, pin 1 goes higher and more current is flowing through Q15, Q13 and Q14 as to raise the output until steady state. The transistor Q12 limits the peak current.

# Controller module

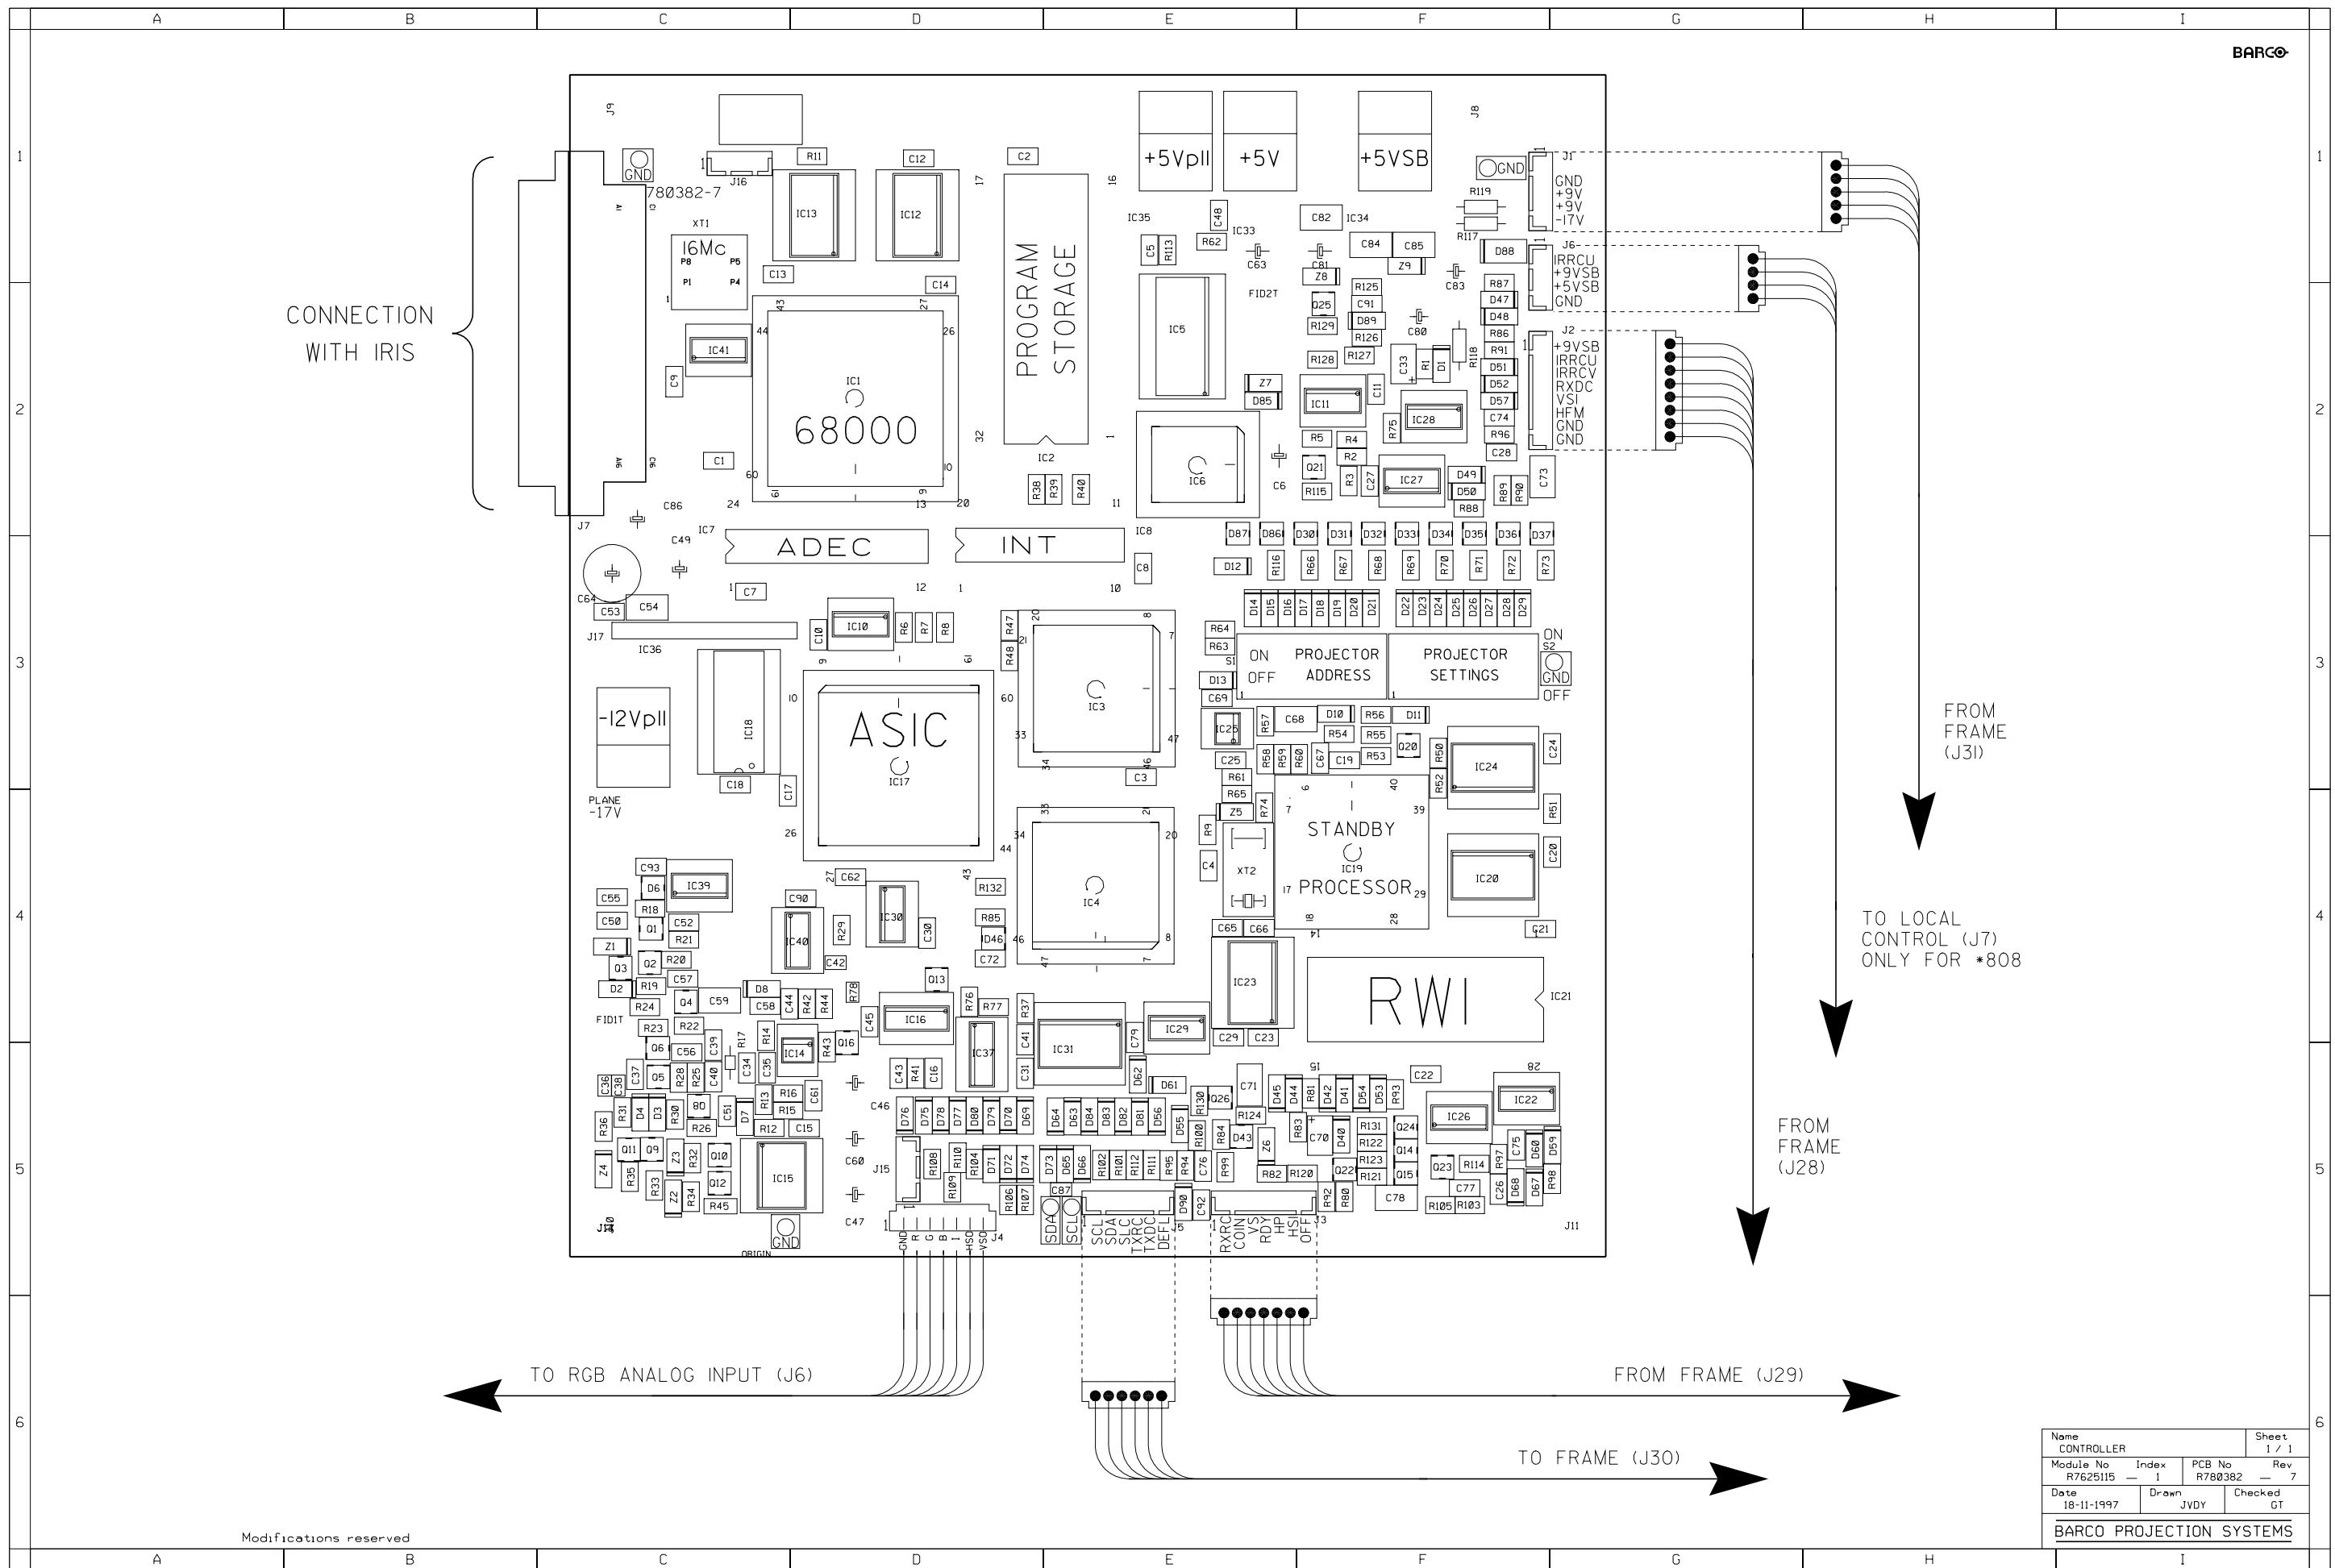

R7625115

## TECHNICAL DESCRIPTION "CONTROLLER"

### Introduction.

The controller module can be divided into four blocks : the RWI (Real World Interface), CTRL (Controller), ASIC and PLL.

Each block has a typical function, but, needs information from the other blocks. These connections are realised by the address / data bus or by "handshake" signals. Address and data are split by a GAL - ADEC (Address DECoder).

The schematic diagram consists of 4 sheets : Sheet 1=Controller, Sheet 2=ASIC+PLL, Sheet 3=RWI and Sheet 4=I/O + Power Supplies.

### Real World Interface

The RWI is responsible for the communication with the peripheral circuitry of the projector, more in particular the PPM (Pulse Position Modulated) commands. These commands can come in via the IR receiver, coming straight from the attached keypad, via the PC communication (RS232) port or the RCVDS port.

This electronic part must be supplied from the +9VSB supply line, as it must be ready in stand-by to respond to an ON command. The state of the switching transistor Q23 (on the I/O) is determined by the "SMPs" line. This is the output pin 11 of IC28, which is supplied from the micro-controller IC19. Whether this line is high or low at the moment the mains is supplied, depends on the DIP switch position "Power ON/OFF" (S2, switch 4).

The data bus of the RWI micro-controller IC19 is connected with the main controller IC2 via a bi-directional buffer IC23.

The multiplexed address/data bus P0 of the microcontroller drives the LEDs D30 - D37 and the DIP switches via the buffer IC24 (74HCT573).

### Watchdog - 9 Volt Watch

The watchdog is built around IC25 pins 1 - 2 - 3 and Q20 transistor. At switching on the projector, the +5VSB is supplied to this circuit. As C68 is not charged at switching on, the output pin 1 is high for a moment in order to reset the microcontroller at pin 10 of IC19 (RST). Pin 3 of IC25 is set at half the supply voltage. The microcontroller triggers the watchdog via C67 in order to keep charged the capacitor C68 by conduction of Q20. If the processor gets blocked for any reason, the level detector output pin 1 comes high and resets the controller as described before. The watchdog has as task to restart the controller when it gets blocked for some reason.

When, during an arcing in a CRT the +5V supply is temporarily shorted, the microprocessor can get in trouble. For that reason, the other level detector in IC25 monitors the 9V (9VWATCH). The output of this detector is connected to the INT0 of the processor.

### Controller(CTRL)

The Controller is built around the chipset 68000=microprocessor, 68230 and 68901. The chip 68230 and 68901 provide the in-/output bit (e.g. PLL-drive, I<sup>2</sup>C coincidence...), the bus connection with the RWI, the serial communication with the RCVDS and the interrupt-inputs.

The Gal IC7 is the address decoder; all I/O are memory mapped. At the same time IC7 provides the DTACK (data acknowledge) of the other components to the 68000. The Gal IC8 provides for the interrupt management and separates RD and WR from RD/WR.

The information adjusted by the user regarding the settings of the different blocks (memory blocks) are stored in the E<sup>2</sup>PROM IC6.

The clockgenerator is built around IC1/XT1. The buffered TXDRCV and RXDRCV are

the communication lines with the switcher / selector RCVDS800 or RCVDS05. The RDY line (Ready line) informs the microprocessor on the status of the switcher (powered up or powered down).

## ASIC

The ASIC IC17 integrates different functions and is custom made for this application. This chip is amongst others responsible for the generation and synchronisation of the text that must be projected on request. The text or pixel information is loaded by the controller into the RAM IC18. Eight bytes are loaded into the RAM via the ASIC during the HFB time. (For that reason, the controller cannot start up when there are no HFB pulses available from the ASIC).

When an external source is selected, the ASIC measures 'frequently' the line and vertical frequencies and informs the main processor if there are changes (change of resolution mode or change of source....).

The pixelclock, generated by the VCO of the PLL, is sent to the ASIC where it is divided down to *HFB* and returned to the phase comparator of the PLL.

When an internal pattern is selected, required by the user or automatically at starting up, the ASIC generates sync signals HSO and VSO.

The R, G and B together with the INSERT are buffered with IC31 and further proceed to the RGB INPUT + SW module.

## PLL

The PLL consists of the digitally edge controlled phase comparator IC15, the low pass filter around IC14, the VCO (Q1 - Q12) and the internal divider in the ASIC. The VCO is a sawtooth generator. C36 is charged up via Q5, driven in the base with the low pass filter output. Note that 0 volts on the base means the maximum frequency. The VCO\_0/1/2 lines can turn on transistors and then additional current is available for the generator.

Via the emitterfollower Q1 and the buffer in IC39, the pixelclock is applied to the CPP input of the ASIC. The PLL phase comparator has a double task. Tune the frequency of the VCO to a multiple of the line frequency and lock the position of the text to the deflection.

The active line period is divided into 256 pixels to position 32 characters on a line in the low frequency range and into 512 pixels (64 characters) in the high freq. range (see Hor defl module).

The *HFM* line informs the processor and thus the PLL on the flyback time, this information is needed to determine the pixel frequency of the PLL.

## Coincidence

The coincidence of the line oscillator is an important information for the controller. At starting up, the controller always generates first internal sync, which must lead to a coincidence situation.

If an external source is selected then, the controller waits for coincidence and the timings of the selected source. These timings are needed to choose the memory block corresponding with the source. If the coincidence is not active, the projector remains blanked (black screen).

## Adjustment procedure for the image width coils

### Adjustment procedure

#### Highest frequency 134 kHz

- Decrease the contrast and increase the brightness to reveal the (background) raster.

- Provide either an internally or externally generated source of **134kHz** to the projector.

- Disable the convergence by entering the Geometry mode and select the Raster Shift adjustment (refer to owner's manual).

- Gently turn the cores of **L10**, **L20** and **L30** in a clockwise direction until there is no more adjustment, i.e. core is fully turned into PCB.

- Identify which raster (R, G or B) has the smallest raster width and adjust the remaining raster via **L10**, **L20** or **L30** in a counter clockwise manner to match the raster with the smallest width. In order to facilitate these adjustments, you may wish to use the horizontal shift control for the raster (R, G or B) that you are adjusting. Disregard any horizontal static convergence errors at this time, they will be corrected later.

#### Lowest frequency 60 kHz

- Provide either an internally or externally generated source of **60kHz** to the projector.

- Disable the convergence by entering the Geometry mode and select the Raster Shift adjustment (refer to owner's manual).

- Gently turn the cores of **L11**, **L21** and **L31** in a clockwise direction until there is no more adjustment, i.e. core is fully turned into PCB.

- Identify which raster (R,G or B) has the smallest raster width and adjust the

---

remaining raster via **L11**, **L21** or **L31** in a counter clockwise manner to match the raster with the smallest width. In order to facilitate these adjustments, you may wish to use the horizontal shift control for the raster (R, G or B) that you are adjusting. Disregard any horizontal static convergence errors at this time, they will be corrected later.

## Scan coil switching (762457)

Each horizontal deflection yoke consists of two horizontal windings which may be connected in either a series or parallel configuration. The inductance of the parallel connection is obviously lower than the series configuration (parallel and series inductance uses the same formula as resistance) therefore they are connected in parallel for the "high" frequency mode.

The lower inductance in the parallel configuration causes the resonant frequency of the flyback pulse to increase, thereby producing a more rapid horizontal retrace.

Note: HDM is the mid-point of the two series connected deflection MOSFETS. HDL is the common connection to the three horizontal yoke windings, that supplies the yokes with the +HTHD voltage, after passing through Q3 and the linearity coil.

The DC horizontal shift voltage from the "Focus and Shift Board (762271) is applied between HDHX and HDLX (X stands for R, G or B or the Red, Green or Blue) of the red, green and blue deflection yokes. The HDLX is in fact a feedback to the "Focus + SHIFT" board in order to stabilize the horizontal width.

In the LOW FREQ mode, the two horizontal width alignment coils are in series. When switched to the "High Freq." mode only one coil is in the circuit, (see schematics).

S10, S20 and S30 allow the horizontal scan to be inverted to adapt the projector for a front or rear projection. S10 is also used to provide the HSIC information to the controller board, so that the controller board will know the configuration of the horizontal scan switches.

The HSI also goes to the "HOR SHIFT+FOCUS" board and is used by Q1 and Q2 to invert the shift voltages on P1 and P2 (horizontal shift Red and Blue).

Note that this board also contains the switch for the inversion of the vertical scan. Here the same VSI info can be used for both, the controller and the Vert Defl board (similar to Hor Defl).

The Scan Fail loop (SF3-SF4-SF5-SF6) passes through two contacts of the deflection connectors. In the event that one of these yoke connectors is disconnected, the projector will go into scan fail, terminating the EHT.

## Adaptation of the E-W correction

when changing the projector configuration to ON AXIS PROJECTION

Normal projection configuration  
(Strap J400 plugged in)

ON AXIS projection configuration  
(Strap J400 removed)

## Adjustment procedure 'VERTICAL DEFLECTION+SYNC MODULE'

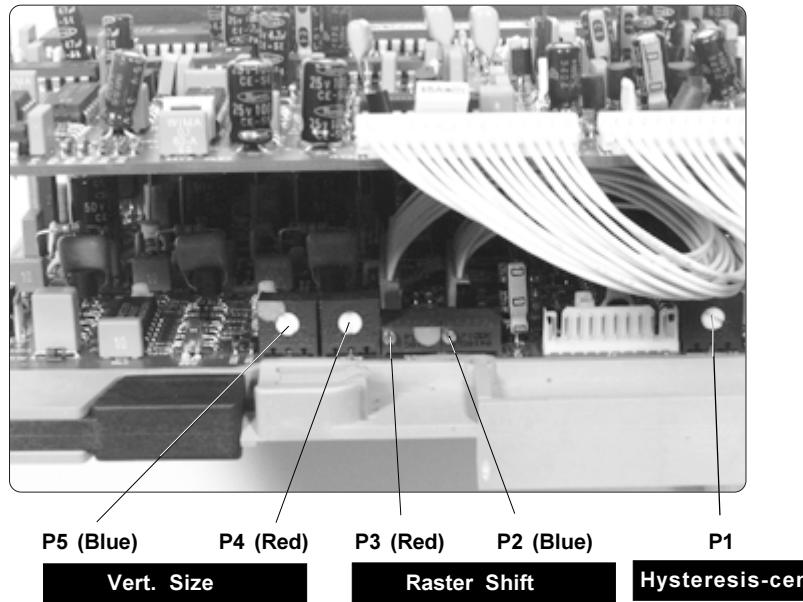

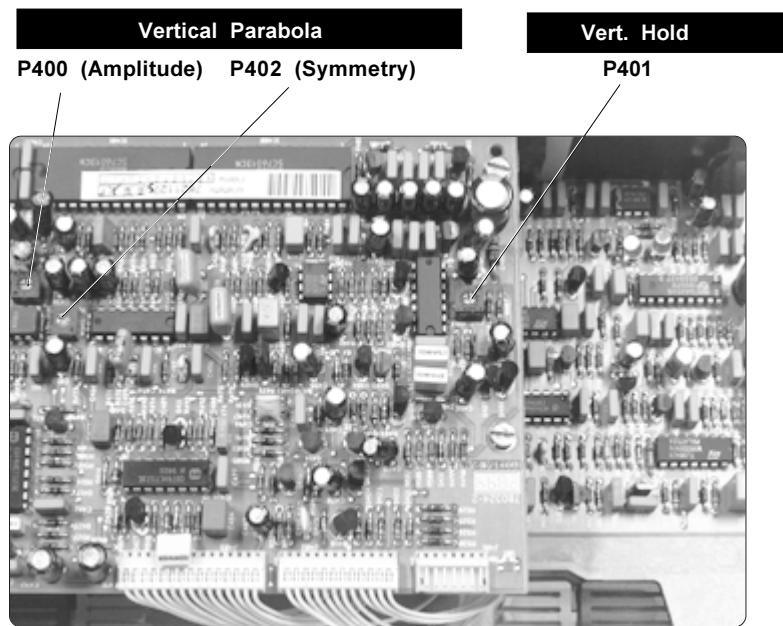

### Introduction

The following adjustments are provided on the **main module**:

- Vertical SHIFT adjustment for RED - P3 and BLUE - P2 image
- Vertical amplitude correction for RED - P4 and BLUE - P5 image

The following adjustments are provided on the **sub module**:

- Vertical Hold P401
- Vertical Parabola: Amplitude P400  
Symmetry P402

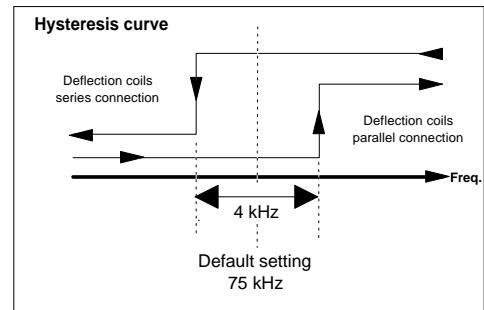

## Adjustments on the main module

### a. Hysteresis-center adjustment for deflection switching relay P1

This control adjusts the switching point of the relay to adapt the deflection coils for low and high line input frequencies.

**Factory default adjustment:** mid position of the potentiometer (switching point of the relay at approx. 75 kHz with a hysteresis of 4 kHz).

**Adjustment range:** the potentiometer P1 adjusts the switchover point of the relay between 60 and 90 kHz.

### b. Main Vertical SHIFT adjustment for RED and BLUE image

**Note:** the mentioned adjustments are provided on the main module in order to correct the Vert. Shift range and the Vert. Amplitude of the red and blue picture after replacement of the respective picture tubes.

#### Preparation

Adjust the vertical raster centering controls for Red and Blue in their mid position. The numeric indicator under the respective bar scale indicates 50. (Refer to the Owner's manual of the projector - Guided or Random adjustment mode).

#### Alignment

Use the vertical shift controls P3 for RED and P2 for BLUE to shift vertically the Red and Blue image until the center coincides with the center of the Green image.

### c. Vertical amplitude correction for RED and BLUE image

Adjust potentiometer P4 for the Red image and P5 for the Blue image to obtain the same vertical amplitude as the Green image.

## Adjustments on the sub module

### a. Vertical Hold P401

- The projector has to operate on a signal (the frequency is not relevant)
- Adjust the potentiometer P401 for synchronisation of the picture (Vertical lock)

### b. Vertical Parabola P400-P402

Adjustment of the **Symmetry** of the vertical parabola P402

- The projector has to operate on a signal with standard frequency.
- Connect the oscilloscope to the resistor R456 (side: output pin 1 of IC409).
- Adjust the potentiometer P402 for a symmetrical curve of the parabola signal.

Adjustment of the **Amplitude** of the vertical parabola P400

- The projector has to operate on a signal with standard frequency.
- Connect the oscilloscope to the resistor R456 (side: output pin 1 of IC409).
- Adjust the potentiometer P400 for an amplitude of the parabola signal of 1.5V.

## TECHNICAL DESCRIPTION "UN SYNC + VERT DEFL" (7621127)

### Introduction.

On this board and its sub-unit we find the sync separator, the horizontal autolock circuit, the vertical oscillator and the vertical output stages.

The generation of the waveforms for the east-west correction signals, the left/right and top / bottom blanking and the composite blanking.

The horizontal drive pulses, with its phase adjustment, for the MOSFET switchers on the HOR DEFL module are also prepared on this board.

A Barco designed IC, called the "BELLA" , comprising four digitally controlled potentiometers, is utilised for the adjustment of the amplitude of the waveforms, or for the adjustment of some DC control voltages. This IC, custom made for Barco, is driven by an I<sup>2</sup>C (serial data) bus from the microprocessor on the controller board.

### 1. Vertical oscillator - Vertical pulses (on the Subunit)

#### a) Vertical Sawtooth Generator

The vertical sawtooth relaxation oscillator is built around the darlington Q403 / Q404 , C464 and the current generator Q408 (all on the subunit of the Vert Sync module). The current that charges up C464 is simulated by another vertical relaxation oscillator built around Q413 / C467 / Q409. The amplitude of the sawtooth of this oscillator is maintained stable, irrelevant the vertical frequency. In order to stabilize the amplitude regardless of the vertical frequency, the charging current must increase with increasing vertical frequencies. The obtained current is then 'mirrored' to the real oscillator.

The initial (minimum) charging current of C467 is taken from the +12V via R525. Additional current is provided by the OPAMP output through the diode D411. This output voltage is determined by the voltage difference between the pins 5 and 6. Pin 5 voltage is adjusted with P401 and determines the "gain" of the loop system. This is the current versus frequency behaviour. P401 is adjusted to obtain locking for the full range of vertical frequencies (see Service manual).

The other input , pin 6, is a reference for the 'average' amplitude of the simulated sawtooth. Therefore, the sawtooth across C467 is buffered and the average amplitude is measured by the Miller integrator of IC407.

The output voltage changes as long both inputs have different potential, and settles down as soon this condition is fulfilled.

The voltage adjusted by P401 determines consequently the average current of the generators for one typical vertical frequency.

In free run ( no sync applied), the ramp voltage is limited by Z400. The OPAMP would then go into saturation (in the free running mode) and the output drops to approx. -10V. As soon "V drive" is applied the voltage now must increase from -10V to around +6 volts before D411 gets forward biased, as from that moment onwards the current 'follows' the frequency. That would take too long and therefore the output voltage of the OPAMP is limited because Q407 gets in conduction as soon the OPAMP output is around +6 volts. Q406 is turned on then and the input current is deviated via this transistor to avoid saturation of the output.

#### b) Synchronisation of the vertical oscillator

The TDA2595 performs well as sync stripper for videosignals because of its noise integrating input. Such a (delaying) input circuit however has a bad performance for computer signals. The LM1881 is better suited for computer sync signals and

consequently the latter is used as sync stripper for all modes except Video / SVID. An automatic detection circuit drives two gating diodes in order to guide the sync from the LM1881 to the TDA2595 or to bypass this one.

## 1. By means of the "V sync" stripped from the composite sync

The "VID/HS/CS" from the "RGB INP + SW" module is capacitively applied to pin 2 of the sync stripper IC4, and to the emitterfollower Q6 on condition D10 is forward biased.

The separated sync pulses at pin 1 go through R55 and D9 to the same emitterfollower on condition D9 is forward biased.

Whether the TDA2595 is used or the LM1881 as sync separator, depends on the condition of the gating diodes D9 / D10.

The composite video mode is detected as follows. The OPAMP 5 - 6 - 7 in IC9 acts as a level detector (no feedback). The video is integrated at the pin 6 input and pin 5 is fixed at a threshold level with R156/R157. For composite video the output pin 7 switches low which results in a saturation of Q7 and thus a blocking of D9.

D16 and D17 are then both forward biased via the stabistor D21. Consequently, the line oscillator is forced at the minimum (15 khz) and the "Freq Mode" is also forced to the lowest range.

The HS/CS' output of the sync stripper goes to the base of Q8 of the coincidence detector and the COMP input of the PPL IC6.

The vertical positive pulses from IC2 pin 9 (VS) leave the main unit and arrive on the subunit at the base of Q418. In order to find these pulses at the collector, Q415 must be conducting to form a ground return for the emitter.

As long no vertical pulses arrive on Q416's base, the latter is not conducting and Q415 is turned on via the R509 resistor connected to the +5V line.

## 2. By the vertical external sync

The vertical oscillator can also be synchronised by VS EXT pulses, separate vertical sync pulses injected into the projector at the VS input. Such pulses can also be delivered by the optional "HDTV Sync interface" if mounted on this unit. The "VS EXT" pulses are inverted by Q416 and trigger the oscillator via D425. The same negative pulses at the collector also charge up C478 to an average low level cutting off Q402 in this case.

### c) "Bella", a Barco customer made IC

The voltage or waveform, applied between VRP and VRN is adjustable in 128 steps and becomes available at the corresponding VO output. The corresponding pins of such a potentiometer are :

**VRP1** : "positive side" of the potentiometer "1".

**VRN1** : "negative side" of the potentiometer "2".

**VO1** : variable out (slider) of potentiometer "1".

Notes :

1. If the signals applied to above inputs are negative and positive with respect to the supply, then, the VSS pin (14) must be supplied with a negative voltage.

2. The amplitude of the input signals is limited to + 3.2V and -1.7V. Measures must be taken to avoid saturation of the input.

The control of these IC's is accomplished with a **SCL** (serial clock) and **SDA** (serial Data) which come from the controller. The address of the IC is determined by the address pins which are grounded or left open (=high).

Obviously, as one IC contains four potentiometers, the address of the IC is followed by a "slave" address selecting the correct potentiometer "0", "1", "2", or "3".

## d) Vertical linearity control

Vertical Linearity control is obtained by adding an adjustable vertical parabola to the sawtooth waveform. That adjusted parabola is in fact the sum of a parabola with fixed amplitude and a parabola with variable amplitude.

The sawtooth is buffered with OPAMP (12 - 13 - 14 of IC407). Behind the buffer we have two outputs for further processing :

- the V SWT , sent to the multiplier, to generate a vertical parabola, and for the keystone correction (E/W correction).
- the VERT SWT , sent to the Bella IC400, for the vertical amplitude control.

The V LIN PAR (pin 7 output of IC406) is applied to :

- the Bella IC400 to adjust the amplitude, the output is labelled "%V LIN PAR."
- the OPAMP IC406 input pin 2 (to be added to the adjusted V LIN PAR).

The OPAMP 1 - 2 - 3 adds the V LIN PAR to the %V LIN PAR and the output is added to the V SWT by R409 / R410.

## e) Generation of vertical pulses from the vertical sawtooth.

### 1. Pulse for overshoot in the deflection

The "black" cathode currents are measured during a small time at the end of the vertical retrace time (top of the picture). To allow a correct measurement, the three beams may not be blanked during that time.

This means that the spot can be visible at the top of the picture.

An extra movement of the electron beam in the vertical deflection at the moment of unblanking can move the "visible beam" to a point beyond the screen. For this extra excursion (or "overshoot" in the scanning) a pulse is generated as follows.

The "V SWT" is capacitively coupled to the trigger input (negative going transient) of IC 414. R492 / R493 installs a DC offset at this input.

The pin 13 (positive polarity) output pulse drives the Mosfet Q402 into saturation at the end of the vertical flyback to produce a maximum excursion of the spot.

The other opposite polarity output of this one-shot , "BL PULSE INV", is used for blanking (see later).

Due to the integrating behaviour of the scan coils, the current is delayed with respect to the voltage.

The ABL pulse to be used in the "RGB - DRIVER " module for the black current measurement has to be delayed with respect to the above "overshoot-pulse".

This is realised by triggering the second one - shot by the trailing edge of the former "overshoot" pulse. The width of this pulse is also a lot smaller compared to the former one.

## 2. Generation of the blanking and unblanking pulses

As mentioned earlier the opposite polarity output pin 4 ( *BL PULSE INV* ) of the double one-shot IC414 is used for blanking (see sheet 2) during the vertical retrace time.

To unblank the video during the ABL time (see composite blanking), the "*ABL PULSE INV*" from pin 12 of the double one-shot is used.

## 3. Pulses for the controller and the RGB DRIVER (ABL measurement)

### V pulse (for the controller)

The two outputs at the pins 13 and 5 are added with D420 and D414 and then buffered with Q417. The "*VPULSE*" is protected by the diodes hooked to the +5V and ground with D419/D418 and sent to the microprocessor-controller board via the main board.

### ABL pulse (for the RGB DRIVER):

The shorter pulse and delayed with respect to the overshoot generated by the second one-shot is buffered with Q411 before leaving this module. It is used on the RGB DRIVER board to determine the time for the 'black current' measurement.

## 2. Vertical output stages, vertical shift and amplitude control

### a. Power amplifiers

The *VERT SWT* at the node R410 / R409 is sent to the BELLA IC406 (VRP0, pin 17) for adjustment. The output VO0 (% VERT SWT) is then passed through the 'ABL overshoot as described above.

It is now capacitively coupled to the inverting inputs of the power amplifiers IC14-IC15-IC17. At the same inputs we find :

- a DC voltage coming from P2 and P3, these are factory set coarse alignments. These coarse alignments also reduce the range of the BELLA potentiometers, thus increasing the resolution of the digital control.
- the vertical shift voltages controlled by the BELLA IC401 on the subunit, G shift, R shift and B shift. The red and blue beam will follow the green shift, because a portion of the green shift voltage is fed to the red and blue shift lines.
- a sawtooth which is proportional with the deflection currents. This is the voltage across the feedback resistors R145, R131 and R110. These are used to stabilise the vertical amplitudes.

The TDA8172 allows for a short vertical retrace time by doubling the supply voltage during retrace.

### b. Vertical scan fail detection

The vertical scan fail circuit is the same for the three deflection output circuits. We limit the discussion to the green output.

The feedback across the feedback resistor R145 is capacitively coupled to the base-emitter of Q22. The conduction time of this transistor is only during the positive portion of the ramp and is determined by the amplitude of the vertical ramp. By the capacitor the shift voltage is removed and does not play a role in the scan fail detection. The (integrated) collector voltage across C102 is thus inversely proportional with the amplitude of the sawtooth. As long as the amplitude is acceptable, the collector voltage is sufficiently low to block Q23.

Either one of the scan fail circuits can saturate Q23 to "cause" the scan fail condition.

### 3. EAST-WEST CORRECTION

#### a. Trapezoidal distortion (sheet 2 of the Subunit schematic).

The DC is removed from the

V<sub>SWT</sub> signal with C440, the amplitude is reduced to match the Bella specifications. The OPAMP inverts the ramp and the output produces a sawtooth that is symmetrical around the zero level, since the non-inverting input is at ground level. Two ramps labelled +/- V<sub>SWT</sub> are available for adjustment by the "0" potentiometer in the Bella IC402. The output is labelled "%V<sub>SWT</sub>" (adjusted Vertical Sawtooth).

#### b) Pincushion distortion.

For the pincushion correction a vertical parabola is required. This parabola is generated by the multiplier IC410. The -V<sub>PAR</sub> output pin 1 of the OPAMP together with the inverted +V<sub>PAR</sub> feed the potentiometer "1" in the Bella IC402. The output is labelled "% V<sub>PAR</sub>" (adjusted Vertical Parabola).

#### c) Line frequency dependent correction - Power Amplifier (sheet 1).

The adjusted waveforms are added with R424 / R425 and then passing the capacitor C422. A small DC voltage obtained from R446/R447 is added to the signal. This small DC voltage undergoes the same gain of the E/W waveform.

The output is passed on to a Miller integrator to remove the waveform and check the gain of the OPAMP. On the other input we apply a portion of the line frequency dependent +HTHD voltage.

The gain of the OPAMP depends on the feedback ratio R445 / Q401. The gate bias of the latter is the output voltage of the integrator. As this voltage is line frequency dependent the gain of the OPAMP follows the value of the HTHD voltage. Note that the +HTHD voltage is not exactly proportional with the line frequency. However, the East / West correction always must be related to (a certain percentage of) the hor. scan voltage.

Depending on the ceiling / table position, the maximum E/W correction is at the top or the bottom of the screen. The feedback time constant between gate and source is adapted accordingly. In table position VS1 is low level and Q405 is on. R471/C444 is added to the R442/C446 time constant.

If the projector is mounted ON-AXIS, J400 link must be removed as in this case there is no E/W correction needed.

The output of the OPAMP, pin 1 (E/W CORR) is sent to the main unit via J403(9) where it is amplified with IC10, a TDA2030 power amplifier. It reaches finally the "UN HOR DEFL" to modulate the scan voltage +HTHD.

### 4. Horizontal oscillator Autolock Phase alignment (on the main board)

#### a) Horizontal oscillator + Autolock

The oscillator in the TDA2595 is locked to the centre frequency by a PLL system in

the IC itself, but the latter has only a limited range of approx. 1.2 khz. Therefore, it serves as a fine lock for the frequency. An additional PLL (4046B), IC6, is used to coarse lock the frequency first.

The 4046B consists of two digitally controlled phase comparators. For this application only the second one is used. The **SIGN** input, pin 14, is the line oscillator "HOSC" of the TDA2595, and the **COMP** input is the comp. sync HS/CS'. The corresponding output is **PC2**, pin 13, a three-level state output.

If the output is open (high impedance), the voltage is set at 6 volts with R58/R59. This voltage can increase or decrease by the push-pull output of the IC. The voltage is buffered and reaches pin 5 of a voltage comparator in IC3. The other input, pin 6, is fixed by R45/R39. The output of the comparator switches on or off the fet Q4 which allows the transfer of the regulating voltage to the TDA2595 when on (shorted).

## b) Coincidence detector

The HOSC (squarewave) switches on and off the transistor Q10. When switched on, any pulse arriving at the base of Q8 is clamped at ground and cannot switch on the latter. When the frequency and/or phase of the line oscillator is different from the composite sync, these pulses arrive on the base of Q8 at the moment Q10 is off. These pulses then switch on and off Q8 and discharge C27 which decreases the voltage at pin 6. The voltage at the other input cannot drop lower than 6 volts due to the zenerdiode Z4.

Consequently, the output pin 7 switches "high" to forward biases Q10. The latter connects the buffer-output with the integrating OPAMP (1-2-3 of IC3).

## c) Locking of the oscillator

The regulating voltage at pin 1 of IC3 drives Q1 via an adjustable zener IC5. The efficiency of the circuit is thus automatically adapted to the line frequency. The collector-emitter current of Q1 determines the frequency of the line oscillator in the TDA2595.

The line oscillator is corrected until it is locked to the comp. sync frequency. The PLL output is now disconnected from the OPAMP input since the coincidence circuit turns off the fet Q4.

From this point on, the fine frequency lock in the TDA2595 takes over and adjusts the line oscillator until the exact frequency and phase is reached.

As the coarse tuning voltage is lost now, the PLL output pin 17 of the TDA2595, feeds now pin 2 of the integrating OPAMP IC3 to establish and maintain the fine tuning loop.

In the locked state, this PLL output is 6 volts. As pin 3 of the OPAMP is set at 6 volts with R8 / R13, the action of the OPAMP continues up to the moment the oscillator is locked to the centre of the hold range of the PLL.

## d) Frequency mode switching - Tracking Hor Freq.

The horizontal frequency tracked voltage "TRACKING HOR FREQ" is smoothed with R73/C47 and compared with an adjustable voltage from the slider of P1 (*Hysteresis centre switching relays*).

The " H FREQ MODE " output is high or low depending on :

- the TRACKING HOR FREQ voltage, thus on the tuned frequency

- the slider voltage of P1.

The slider voltage is limited both sides with R77 / R87. The user / service engineer can only determine the "high" or "low freq. mode" in some window, the mid range of frequencies.

As is discussed in the "UN HOR DEFL" board the two parts of the scan coil windings are in series in the "*lower freq mode*" range and in parallel in the "*higher freq mod*". The "H FREQ MODE" voltage is obviously sent to the deflection circuits to activate the relays.

Since the flyback time in the second range is half the flyback time of the lower range the microprocessor must be informed on the actual range the projector is running. The "*H FM*" is consequently sent to the microprocessor - controller board.

The "*TRACKING HOR FREQ*" in the schematics, is proportional with the line frequency and will be used to track some waveforms with the line frequency.

## e) Line flyback pulse simulation

The phase of the *HS* squarewave output, pin 4 of the TDA2595, is determined by the position of the pulse applied to pin 2 (*LFP*). Delaying this pulse with respect to the drive pulse of pin 4 will mean that the drive pulse will be shifted back in the time for about the same amount of the delay.

The width of this pulse also is the width of the *SC* (Sandcastle) which exits at pin 6. This pulse is generated by means of two one-shots in IC7. The first one generates a pulse starting at the end of the scan (= positive transition of the squarewave) and with a duration determined by the time constant of the one- shot. This duration is relevant for the delay.

The second one-shot is triggered at the negative transient of the first pulse thus the output pulse starts with the end of the first pulse. The duration of this pulse will be the duration of the *SC* pulse.

As the *TRACKING HOR FREQ* voltage is not at the correct dc level, nor has the correct range (efficiency), the voltage is put to a suitable range with an OPAMP and Q5 in the feedback loop. The output is dropped with Z1 and drives simultaneously Q11 and Q9. The delay, this is the width of the output pulse at pin 6 of the one shot in IC4, is regulated by Q9.

The width of the pulse at output pin 10 is regulated with Q11.

## f) Phase alignment :

The HOSC squarewave is not suitable for driving the MOSFETs in the horizontal deflection. Two one shots will derive a drive pulse with the correct width and position by means of an adjustable delay (=phase) with respect to the (reference) input sync signal.

The adjustment range over the entire frequency range must be proportional with the line period.

The range in *absolute* value must be much lower for the higher frequencies than for the lower frequencies. The *relative* value (percentage) must be the same. This is obtained by tracking the phase range with the line frequency by means of an automatic system (feedback) as described hereafter.

The "*PH CONTR*" voltage from the BELLA IC401 on the subunit is sent via R405 to contact 8 of the J402 connector. The optional ORBITING module can here overrule the PH CONTR if the projector is switched as a SLAVE.

Anyhow, the phase controlling voltage arrives at one base of the differential amplifier Q17. The other transistor in Q17 receives the integrated pulses of pin 13. This DC voltage is proportional with the width of the output pulses and the line period. Assume we have set the phase voltage at 2 volts. The comparator will now adjust the width of the output pulses at pin 13 until both bases of Q2 carry the same 2 volts. Therefore, the width of the pulses will be narrower when the line period decreases, thus for the higher frequencies. Note that the width of this pulse here is the phase delay time.

Indeed, the other one-shot now is triggered with the negative pulse of pin 4 on the positive going transient.

The width of the horizontal drive pulse is tuned by R89 / C64.

The positive drive pulses at pin 5 are sent to the controller to lock the PLL of the textgenerator. By using locking pulses which have undergone the phase shift, the text on the screen is not affected by the phase control but fixed to the scanning. The negative going pulses at pin 12 are slightly amplified and buffered with Q15, buffered with Q16 and sent to the "UN HOR DEFL" module.

## 5. Adjustable blankings

### a) Left / right blanking

The Left/Right Blanking pulses are generated by two one-shots in IC413 which are triggered with "*L PULSE*" (FlyBack pulses from the Hor Defl board).

The available range of the

BELLA potentiometers of IC402 is 0 -1.5 volts. This range should allow the same relative blanking irrelevant the line period. Therefore, the absolute value must be smaller at higher frequencies. A feedback system is used that automatically adapts the width of the pulse to the line period (compare this with the phase alignment where a similar problem is solved in a similar way).

Pulses, coinciding with the start of the flyback time, and, having a width set by C470/ Q412, exit at pin 13 of IC413. These pulses are integrated and the resulting voltage is sent to pin 10 of IC408 to be compared with the voltage at pin 9 (=*LEFT BL*). The OPAMP's output is fed back to the input pin 2 with a Miller capacitor. The current of Q412 is adapted until both voltages at the pins 2 and 3 are identical.

The "*LEFT INV*" is connected to the gating (adding) diode D430 or pin 1 of the NAND gate IC415.

To generate the blanking pulse for the end of the scan, the inverted output at pin 12 is integrated and compared with the BELLA voltage *RIGHT BL*.

The pulses *RIGHT INV* are applied to the same NAND-gate input via D429.

### b) Top / Bottom blanking

To achieve a high accuracy, or, in other words, to dispose of a steep ramp, the sawtooth is sent into a "dead band response amplifier" built around the OPAMP 9 - 10 - 8 in IC409.

The sawtooth *V SWT* enters pin 9 capacitively. The output is inverted and the clipping levels are set by clamping circuits : R465/D404/D405 and R483/D407/D406.

The modified waveform is now sent to two level detectors of IC412, on the inverting and the non-inverting inputs. A potentiometer of the BELLA IC400 and another one in IC401 adjust the DC levels of the other inputs.

The outputs are added and applied to the "Data" input of an RS-flipflop of IC411. The clock input of this RS-FF are line pulses, the output is in this case always a multiple

---

of a line period to avoid the half line offset with interlaced signals.

### c) Composite blanking

The user controlled blankings are added with gating diodes to the same input of IC415. The other input of this NAND gate are the vertical blanking pulses during the retrace time "BL PULSE INV". The output is now combined with the UNBLANKING ABL pulse "ABL PULSE INV". The output is inverted with another NAND gate of the IC415 and the COMP BLANKING is finally leaving to the RGB DRIVER module.

# Sync+Vertical Deflection

R7621127

Mounting the HDTV interface R762268T on the Sync+Vertical deflection module

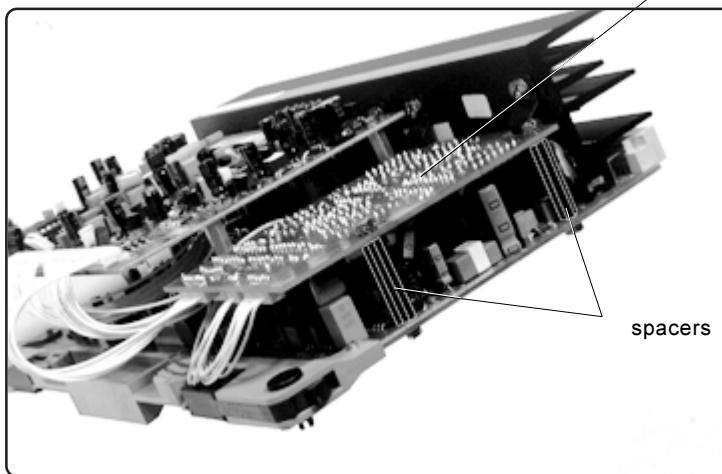

HDTV interface R762268T

Interconnection

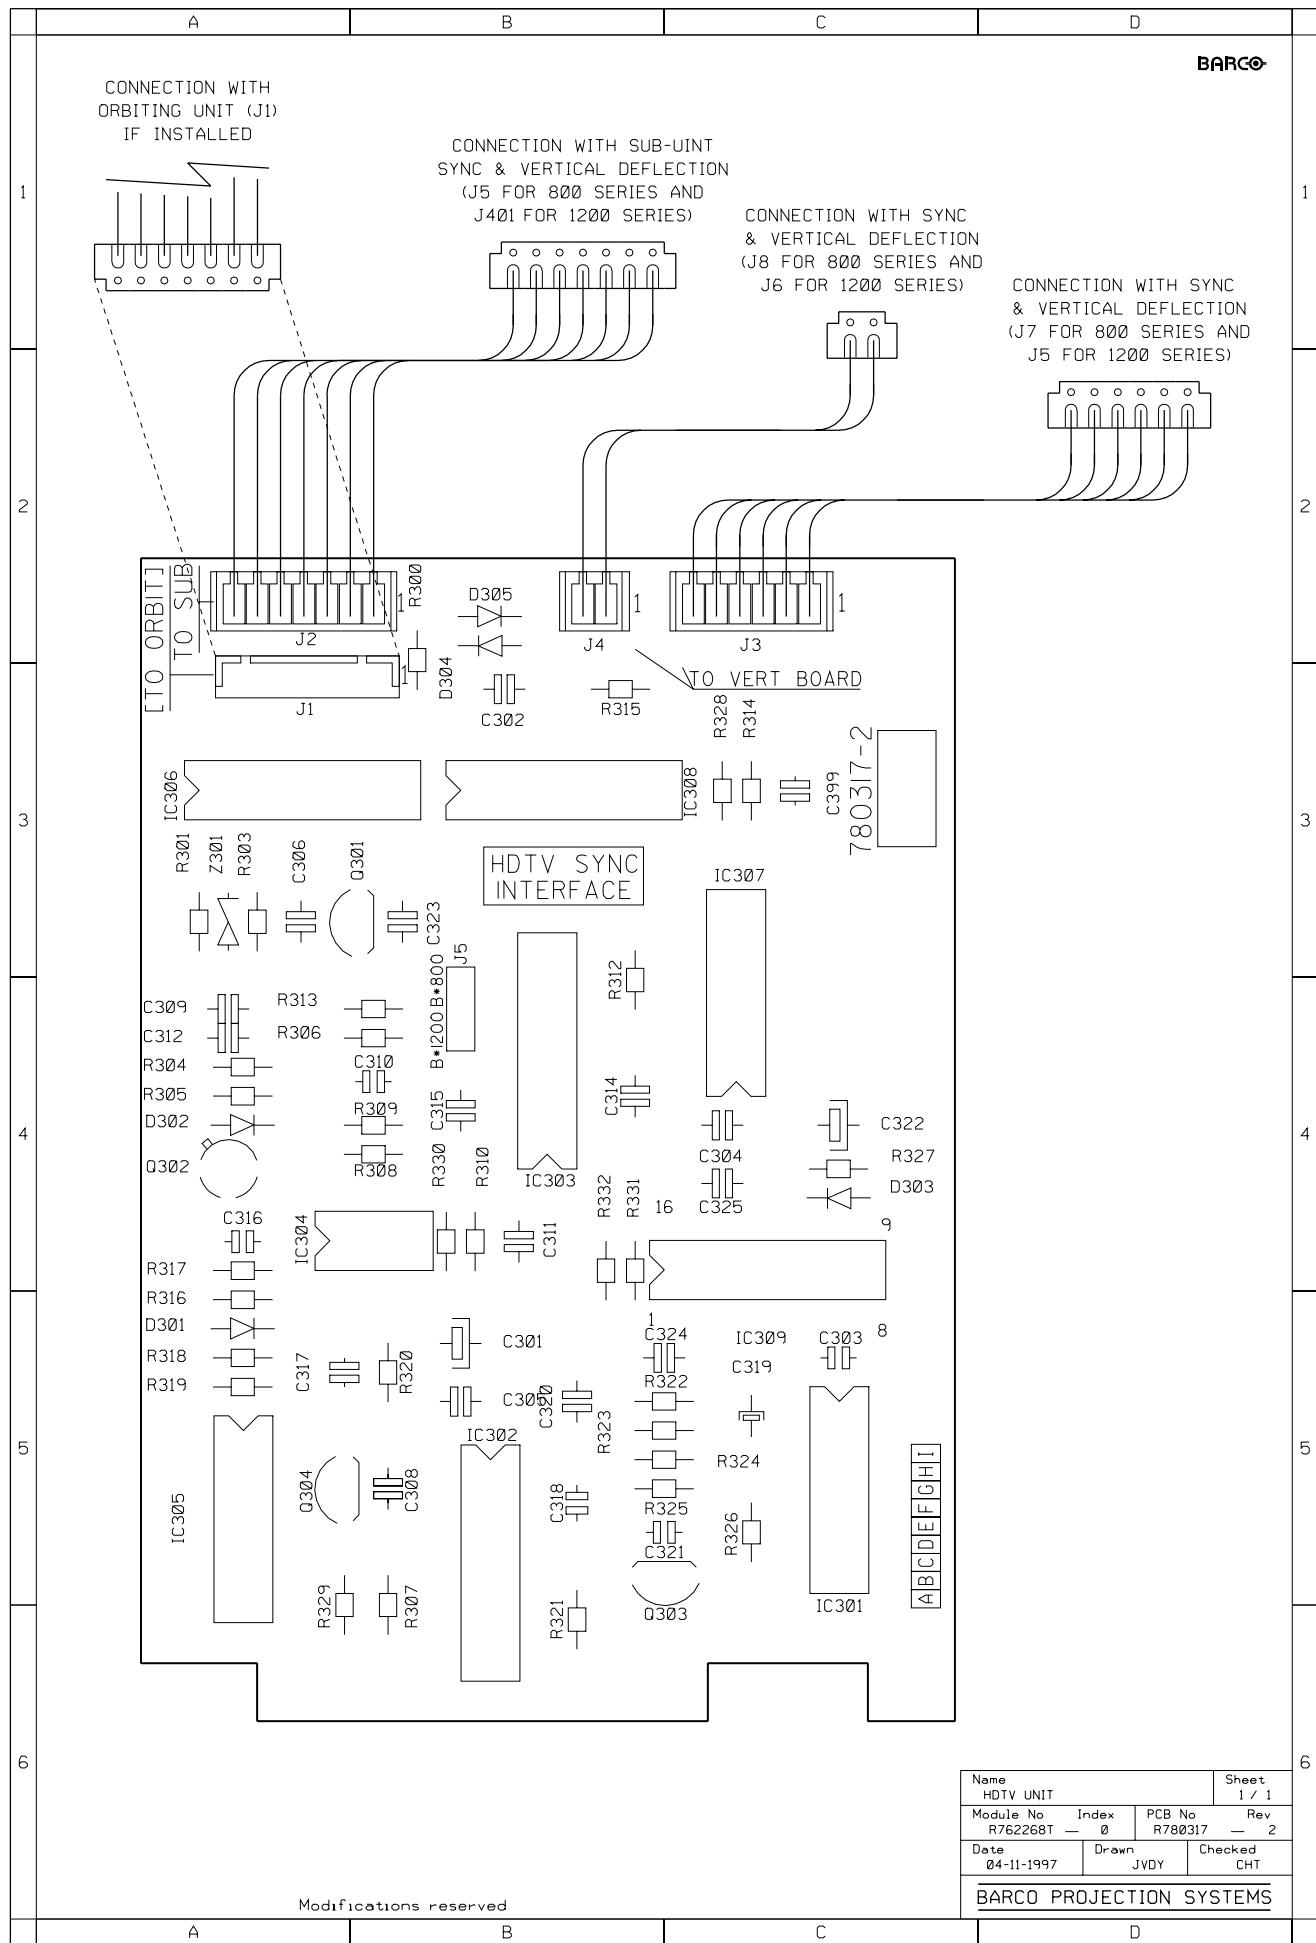

Mechanical mounting

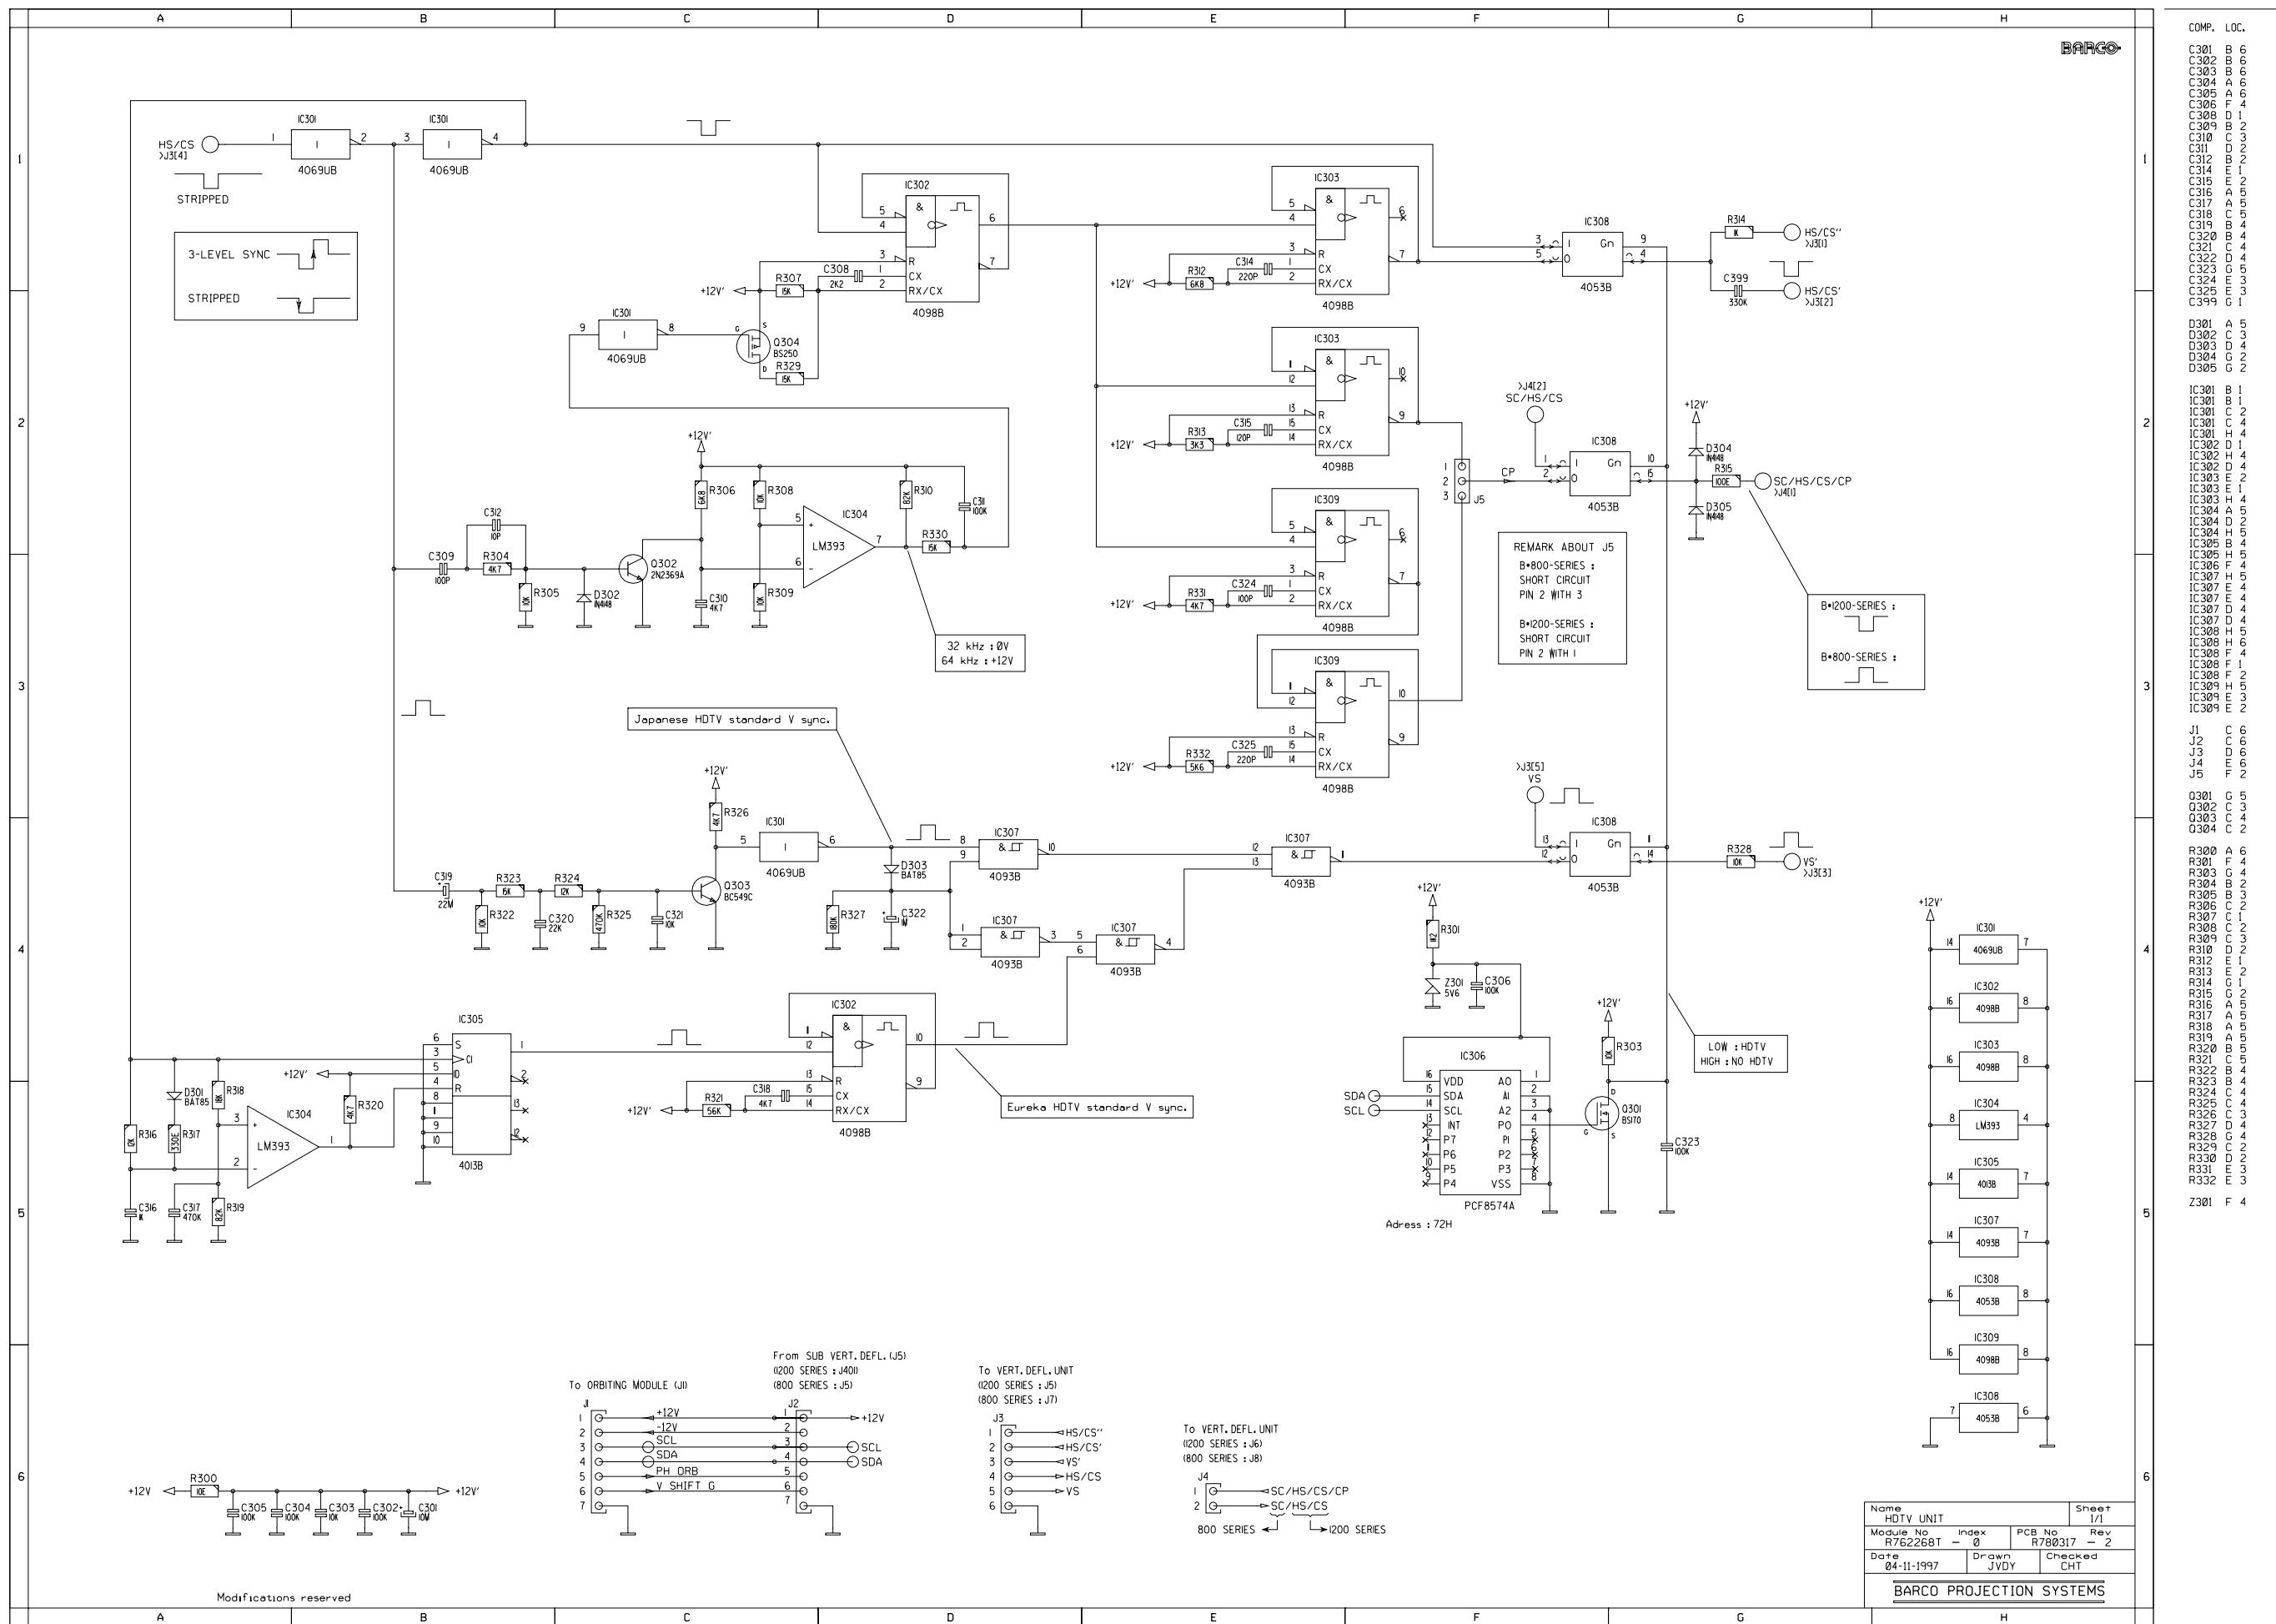

## Modifications on the main module for proper HDTV operation

Remove on the main module the resistors R55-R68-R90 and the capacitor C49

## Introduction

The following adjustments are provided:

**a: Over voltage protection (=scan hold down) P2**

**b: Horizontal linearity adj.**

Linearity coil at 15 kHz

Potentiometer P1 at 18 kHz and

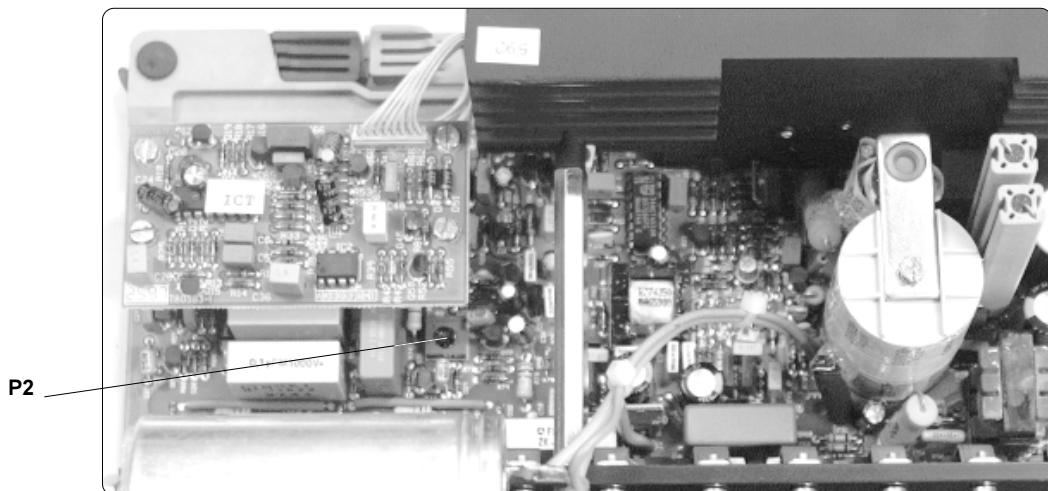

Potentiometer P64 at an input signal with 1.25us flyback time

## Overvoltage protection

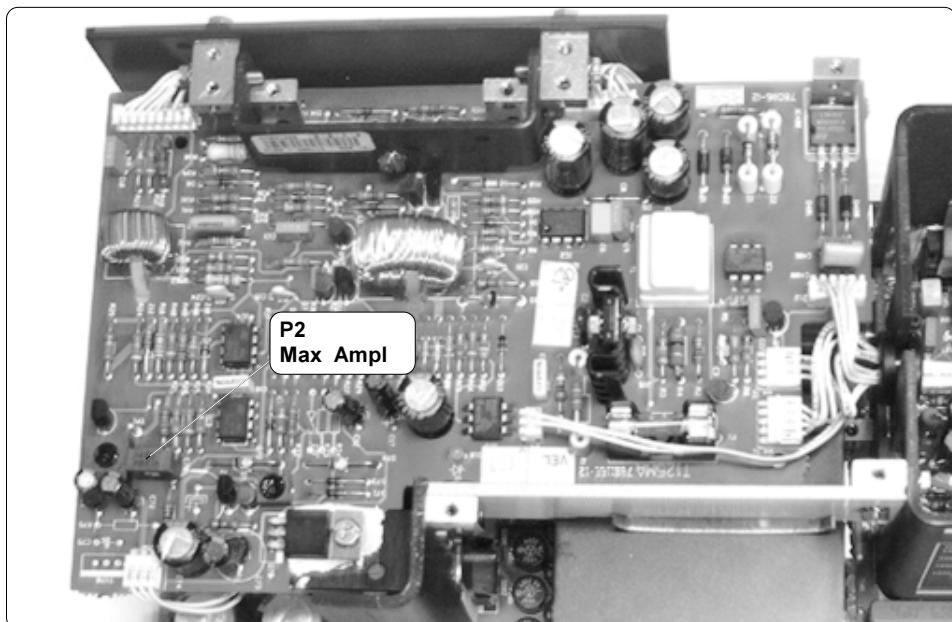

### Preparation

Switch OFF the projector

Adjust P2 to its physical minimum (turning counter-clockwise)

Adjust P2 "MAX HOR. AMPL." **on the SM Power Supply** to its physical minimum (turning counter-clockwise).

## Adjustment

Switch **ON** the projector.

With respect to chassis ground, measure the dc voltage at the cathode of the diode D19.

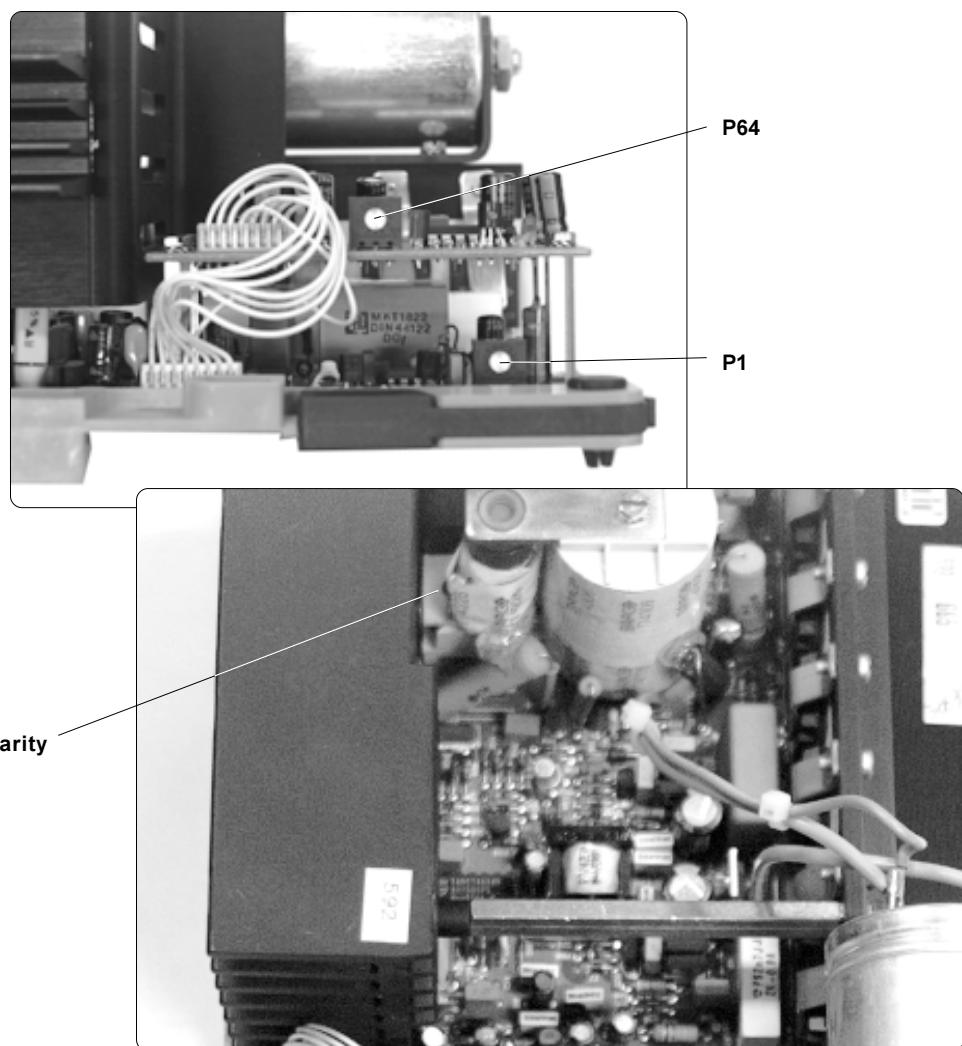

Adjust P2 **on the SM Power Supply module** for 1950V DC.

Adjust P2 **on the Hor. Deflection module** (turning clockwise) until the **Horizontal Amplitude** of the projected picture begins to reduce.

Re-adjust P2 **on the SM Power Supply** as explained in the adjustment procedure of the SM Power Supply (refer to the corresponding service sheet)

## Horizontal linearity

1. Adjust the core of the linearity coil using a 15 kHz input source.
2. Adjust P1 using a 18 kHz input source.
3. Adjust P64 using an input source with a retrace time of 1.25us (Green LED on the sub module R7621085S lights up to indicate the high frequency range).

## HORIZONTAL DEFLECTION AND SCAN SWITCHING MODULES BG1209S (R7621085 AND R762457)

### Introduction.

On this board we find the MOSFET switching transistors, acting as switches to start and stop the currents through the deflection coils. As we need a very short retrace time, the amplitude of the flyback pulse is bigger than the maximum of one Mosfet. Therefore, two Mosfets are used in series. On the other hand, the amplitude of the current, especially in the mode where the two half windings are in parallel, is so high that the scan current must be divided over two Mosfets in parallel.

The very high scanning computer sources require a very short retrace time and thus blanking time of the projector. The lower scanning frequencies do not require such a short blanking time.

This is obtained by switching the two horizontal deflection windings of the deflection yoke unit in parallel (we further call this the "**Higher Freq Range**" ) for the high scanning frequency.

For the lower scanning sources however these same two windings on the yoke are connected in series in order to double the retrace time compared with the parallel connection (further called the "**Lower Freq Range**" range). This switching of the yoke configuration is accomplished with three relays on the "Deflection Switching Module" mounted on the CRT unit cover.

When switching from the low range to the high range, or vice versa, the deflection voltage +HTHD on the SMPS **MUST** be switched off (or at least reduced) the moment the relays are active.

The circuits which inhibit the deflection voltage and the drive circuit which control these relays are located on the Subunit of the Hor Defl. board.

Furthermore, on this board, we find the required protection circuits such as "scan hold down" and "scan failure".

### Preparation of the drive pulses.

The horizontal deflection circuit uses two MOSFETS in series in order to be capable of handling more than 1000 volt pulses. Therefore, two drive pulses on different ground reference levels are required.

The "bottom" MOSFETS are driven by a pulse train referenced to ground or chassis ground, the "top" MOSFETS by drive pulses referenced to the mid-point of the two series connected MOSFETS, the HDM point. The Vcc of each opto-coupler must therefore have a different ground reference.

The power supply for generating the "top drive pulses" is taken from the +17 volt via diode D33 to block the pulses, as HDM, the reference ground for the top drive pulses, carries line pulses.

The hor. drive pulses, prepared on the "UN SYNC+VERT DEFL" board, are sent to the amplifier Q13. By using a transformer T2, a "floating" drive pulse referred to HDM for the top Mosfets can easily be obtained.

When the flyback pulse is present during retrace, D33 becomes reversed biased and act like an open circuit to the 17VDC line. At that time, the drive circuit receives its voltage supply from the charge stored in C48.

The "high" drive pulses reach the gate-source of the top Mosfets, and the "low" drive pulses drive the bottom Mosfet switches.

## Modulation of the scan voltage / East-West correction

The +HTHD voltage from the SMPS board is modulated in Q3 by the East-West correction signal prepared on the "Sync + Vert Defl" board. Z2 protects the transistor and SR2 limits the charging current of this coupling capacitor through the zener. Q2 transistor is used to discharge the boosting capacitor C31 at the start of a vertical scan. A vertical flyback pulse, derived from VDH B (Vertical Deflection High Blue) is sent to the gate. This minimizes keystone problems at the top due to a remaining charge on C31 after the vertical retrace. It causes the charge on C31 to always start from the same amplitude after each vertical retrace, regardless of the voltage that was built up at the end of the vertical scan.

## Horizontal linearity tracking control.

The problem we meet with such a big frequency range, is the frequency dependent characteristic of the linearity coil. At a higher scanning frequency, the impedance of the linearity coil would increase.

To overcome this, a second coil T1 is magnetically coupled to the standard linearity coil. This current in this modulating coil is delivered by a Mosfet Q1.

The needed current for tracking is got via the biasing circuit of the gate of Q1 (LIN HIGH) as follows.

The drive pulses trigger a one-shot in IC1 at the positive going transient input. The output pulses are then applied to the gate of a Mosfet Q8 and at the drain split to two circuits :

- the simple integrator R20 / C3, the obtained voltage across the capacitor is consequently a voltage proportional with the line frequency labelled "L/N REF".
- the push-pull Q5 / Q6 and the top/top detector just to obtain a negative voltage to supply amongst others the OPAMP IC2.

The DC level of this L/N REF voltage is not correct to drive the Mosfet Q1 and a level shift is realised with the OPAMP 1-2-3 of IC2.

This OPAMP receives at the inverting input a voltage that is proportional with the line frequency, the amplitude adjustment does not affect this L/N REF voltage.

The other non-inverting input receives a voltage that is proportional with the scan voltage. This voltage is proportional with the line frequency and with the amplitude adjustment. The influence of the amplitude adjustment must be minimized and this done as follows.

For one typical frequency, we obtain one typical L/N REF voltage. The HTHD voltage however depends also on the horizontal amplitude. Any change in the emitter voltage of Q4 is compensated via the feedback Q7 - base Q4.

**Corrections in the "Higher Freq. Range".** In the "High Freq. Range" mode, due to the change of the flyback time and the appropriated scan voltage, adaptations on different line frequency dependent circuits (on the subunit) are required.

The HFM (Hor Freq. Mode) voltage, coming from the "UN SYNC + VERT DEFL" is compared to the level set by R31/R32 in the level detector 5-6-7 of IC2.

The output changes from high to low or vice versa are detected by IC1 to turn off the scan voltage (see later).

The output level is further inverted by a similar detector and the output pin 1 is used for different functions :

- a) To switch on and off Q45. When this transistor is "on", the relays on the "Deflection Switching" module are "activated". These relays realize the commutation from series to parallel. The same transistor also "serves" the relay "REL1" on the HOR

DEFL board. With this relay a correction on the linearity coil is obtained between the high and low frequency ranges.

- b) To switch on and off Q58. This transistor permits a correction on the efficiency of the HTHD voltage for the second range of the input protection circuit (transistor Q9 - IC1) that will be discussed under the paragraph "Protections".
- c) To switch on and off Q60. When this transistor is 'on' the LIN REF voltage is dropped by the divider R20 / R63 (=on the subunit) as a compensation for the drop of the HTHD voltage.
- d) To switch on and off Q59. When "on", P64 is added in parallel to the gate of Q1 and allows a correction on the linearity tracking

## Protection circuits.

### a) Overcurrent protection.

If the sum of the currents of the three scan coils exceeds a pre-determined level, the drive is inhibited as follows :

The wire J2-J3 in series with the three scan coils , acts as a low value resistor and is connected across the base-emitter of Q16. When a 0.6 volt or greater voltage is dropped across the wire, Q16 starts to conduct and triggers the monoflop Q10/ Q14. As long Q10 is blocked, the drive transistor Q13 remains "on", inhibiting the drive. BY re-applying the drive pulse to the base of Q10 via D9 (a kind of feedback), a faster reaction on the overcurrent can be obtained.

### b) Ovvoltage protection.

The sum of flyback pulses on each of the series connected Mosfets are checked by a rectifier network consisting of diodes D30, D31 and D32 and common decoupling capacitors. The pulses at the node of the two Mosfets (HDM ) are rectified with D24 . This voltage must be half of the total flyback voltage in order to protect the mosfets against overvoltage. This is realised with the circuit R73/C46/ D24/SR5/R56/C32.

The rectified voltage is dropped with R52 / P3 / R51 and sent to two level detectors. The threshold level is set by a zener at 6.2 volt with Z5. At the moment pin 6 of IC2 exceeds the threshold, the horizontal amplitude is reduced with Q11. This will avoid the action of the "Hold Down Deflection" protection circuit.

If for any reason, the 1950V level is reached the HOLD DOWN DEFLECTION circuit is activated.

- 1) The drive is inhibited through the DEFL OFF.
- 2) The input pin 6 remains "high" as transistor Q12 is blocked and D18 conducts via R28 to keep pin 6 of IC1 high. This requires that the set be powered off to reset this circuit.
- 3) The red LED D10 ( HOLD DOWN DEFLECTION) is illuminated in order to show that "scan hold down" has occurred.
- 4) As the deflection is stopped, there is also a horizontal scan failure and the associated circuit will drop the EHT voltage and blank the three CRT's to prevent damage to the CRT phosphorus.

### c) Too low drive protection (+17V monitoring).

It is imperative that the Mosfets are fully switched on, so that the internal resistance will be as low as possible. Due to the large deflection current, even a small amount of excess resistance, will cause the Mosfets to generate too much heat.

This Mosfet drive pulse amplitude depends in part on the **+17 volt** supply and the

voltage supplied from the +17VDC line. The drive signals are developed from the 17VDC and to prevent damage, due to insufficient drive, if this voltage becomes too low, IC1 pin 3 gets low and inhibits the drive signal via the 'DEFL OFF'.

The DEFL OFF is connected with the R(eset) of the monoflop in IC1. The function of the latter will be explained hereafter.

## d) Input protection :

The H DR from the UN SYNC + VERT DEFL has as task to start and stop the conduction of the Mosfets. If however the Mosfets are in conduction and there is a "stop" that does not arrive, there is a risk of damaging the power switchers. In such case, a stop pulse will be automatically generated by the monoflop in IC1, output 7. This output remains low as long the input is retriggered at pin 5. When such a trigger pulse is absent, the output switches high after a time determined by the time constant R25 / C5 + current delivered by Q9. This current is tracked with the line frequency by using the scan voltage as emitter supply. Note that a correction on the base voltage occurs in the second range with Q58 on the subunit.

## e) Horizontal scan failure.

Horizontal pulses are fed into the transistors Q17, Q21 and Q19. As long as there are horizontal pulses on the base of these transistors, they are conducting for each horizontal period, and the collectors are held "low" by C33, C44 and C37. These smoothed collector voltages keep the gating diodes D28, D29 and D26 blocked. If either one of the pulses or all pulses are missing, Q19 transistor gets in conduction and turns its collector at low level. The SF line will be pulled low and the scan fail condition will be met.

## f) Inhibition of the scan at relay switching period.

The **HFM** (=Horizontal Frequency Mode) **voltage** (HIGH in the "low freq." range and LOW in the "high freq." range) comes from the "Sync+Vert Defl" board. This voltage is applied to IC2 pin 5 (on a level detector in IC2).

When HFM switches from HIGH to LOW (when the "high freq. range" is selected), the output follows, and, a negative voltage transition occurs at the output. This negative transition triggers the monoflop on the "active low" pin 5 input of the monoflop IC1.

When on the other hand the freq. mode changes from "Low" to "High", the positive transition triggers now the monoflop at pin 4 ("active high").

The end result is that for either transition, the output pin 6 will go "High". The time that it will remain high is determined by the time constant C26/R25.

The "high" at pin 6 turns on the red LED D8 and it will stay on as long as pin 6 is "high".

The second inverted output pin 7 (low pulse) turns off Q15. The collector of this transistor "DEFL ON" is connected with the SMPS and as this an active LOW output, the scan voltage +HTHD is inhibited when this DEFL ON voltage is high (see SMPS).

Therefore, the scan is inhibited, when Q15 is "OFF" during switching of the frequency range.

## **Starting conditions**

When the projector is first turned on, Q16 is forward biased due to the high charging

current of C20 through R18. This causes a "high" on the base of Q16, pulling its collector "low". During the charging time the HTHD is dropped and the Hor Scan is inhibited.

When C20 is charged, Q16 turns off releasing Q15's base and switching on the scan voltage +HTHD.

This delayed start of the HTHD allows the monoflop circuit in IC2 to reach a "steady state" since the line oscillator first has to lock to the selected input source.

### **Feedback to the SMPS (to stabilise the horizontal width).**

The scan voltage +HTHD has to track the line frequency in order to regulate the horizontal width of the picture. The amplitude of the flyback pulses at the connection of the top and bottom Mosfets (=HDM) is a direct result of the horizontal width and can be taken as a reference. These pulses are coupled and isolated by transformer T3, rectified by D34 and the **FBHD** voltage is sent to the SMPS, to regulate the HTHD.

This voltage is proportional to the width of the raster on the CRT faceplate.

### **g) Scan coil switching (R762457).**

Each horizontal deflection yoke consists of two horizontal windings which may be connected in either a series or parallel configuration. The inductance of the parallel connection is obviously lower than the series configuration (parallel and series inductance uses the same formula as resistance) therefore they are connected in parallel for the "high" frequency mode.

The lower inductance in the parallel configuration causes the resonant frequency of the flyback pulse to increase, thereby producing a more rapid horizontal retrace.

**Note:** HDM is the mid-point of the two series connected deflection MOSFETS. HDL is the common connection to the three horizontal yoke windings, that supplies the yokes with the +HTHD voltage, after passing through Q3 and the linearity coil.

The DC horizontal shift voltage from the "Focus and Shift Board (762271) is applied between HDHX and HDLX (X stands for R, G or B or the Red, Green or Blue) of the red, green and blue deflection yokes. The HDLX is in fact a feedback to the "*Focus + SHIFT*" board in order to stabilize the horizontal width.

In the LOW FREQ mode, the two horizontal width alignment coils are in series. When switched to the "High Freq." mode only one coil is in the circuit, (see schematics).

S10, S20 and S30 allow the horizontal scan to be inverted to adapt the projector for a front or rear projection. S10 is also used to provide the **HSIC** information to the controller board, so that the controller board will know the configuration of the horizontal scan switches.

The **HSI** also goes to the "HOR SHIFT+FOCUS" board and is used by Q1 and Q2 to invert the shift voltages on P1 and P2 (horizontal shift Red and Blue).

Note that this board also contains the switch for the inversion of the vertical scan. Here the same **VSI** info can be used for both, the controller and the Vert Defl board (similar to Hor Defl).

---

## **Horizontal Deflection**

---

**R7621085**

---

The Scan Fail loop (SF3-SF4-SF5-SF6) passes through two contacts of the deflection connectors. In the event that one of these yoke connectors is disconnected, the projector will go into scan fail, terminating the EHT.

## Adjustment procedure "MAGNETICAL FOCUS+SHIFT"

### Introduction

The following adjustments are provided on the **main module**:

Horizontal SHIFT adjustment for RED - P2 and BLUE - P1 image

### Adjustments

#### Horizontal SHIFT adjustment for RED and BLUE image

**Note:** the mentioned adjustments are Horizontal shift 'course' adjustments for the Red and Blue picture tube.

##### Preparation

Adjust the Horizontal raster centering controls for Red and Blue in their mid position by means of the Remote Control Unit. The numeric indicator under the respective bar scale indicates 50.

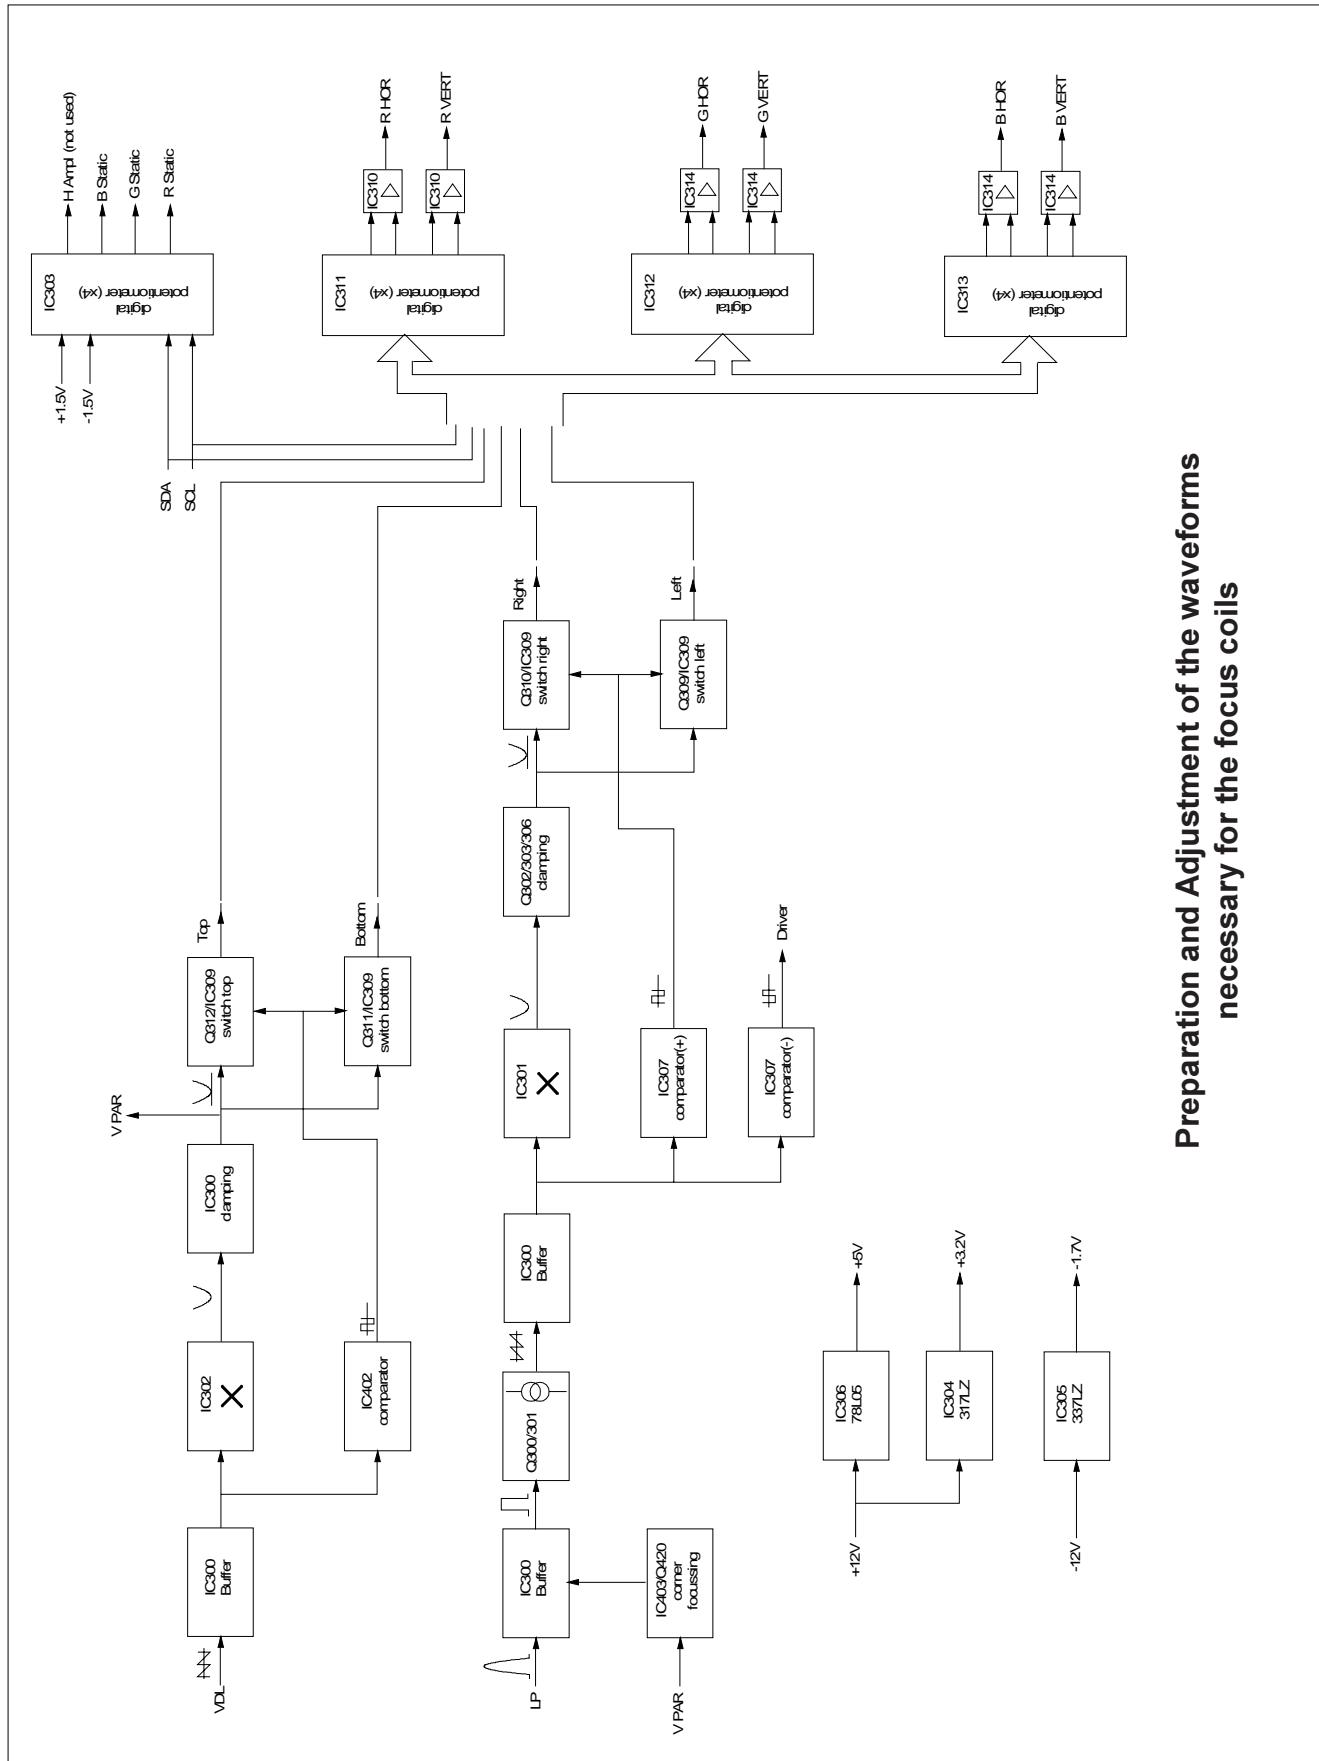

(Refer to the Owner's manual of the projector - Guided or Random adjustment mode).

##### Alignment

Use the Horizontal shift controls P2 for RED and P1 for BLUE to shift horizontally the Red and Blue image until the center coincides with the center of the Green image.

## Horizontal Shift

## Focus output

## TECHNICAL DESCRIPTION “FOCUS - SHIFT”

### Introduction.

Two completely independent functions are performed on this board and its subunit, the electromagnetic focus and the horizontal shift.

On the main board we find the Horizontal shift circuits and the power stages to drive the focus coils.

The preparation and adjustment of the waveforms necessary for the focus coils are accomplished on the sub-unit.

To obtain an independent left/right and top/bottom adjustment of the electromagnetic focus, the waveforms are clamped during one half of a scan period.

### A. Electromagnetic Focus principle.

In this form of focusing, a strong magnetic field produced by an electromagnet or a permanent magnet mounted behind the yoke on the neck of the CRT forces divergent electrons to take a helical (coil-like) path to reach the CRT faceplate. The helical path is usually only one turn long. With the proper magnetic field strength oppositely divergent electrons will move forward along coil-like paths that rotate in opposite directions and meet at the phosphor screen, thereby bringing the electrons together again to form a small spot.

#### a) At line frequency :

A sawtooth generator is built around Q300 / 301. C302 charges up via the variable (line tracked) current generator Q300, and discharges via Q301 when a horizontal pulse is sent to its base. This pulse starts slightly before the end of the horizontal scan in order to obtain sufficient energy at the start of the horizontal scanning. The trigger pulse is generated in two steps by the two monoflops of IC401. By an integration (= averaging) of the pulse train at the output pin 13, an automatic tracking of the trigger moment with the line frequency is got.

C302 then charges, and its rate of charge is determined by the condition of the current generator Q300. Q300 is supplied with the + FOCus voltage from the SMPS, which is in some way proportional to the line frequency. A vertical parabola is added to this charging current via C422.

Because of this, a tracking of the amplitude sawtooth signal with the line and vertical frequencies is developed.

The sawtooth signal is now applied to :

- a multiplier IC301 in order to generate a symmetrical parabolic waveform, regardless of the line frequency.
- a level detector in IC307 pins 3, 2 and 1 to produce a left-right squarewave which is buffered by Q307 and feeds the switchers-clampers Q309 and Q310 with a correct DC level (note that Q307 is supplied with + / - 12 volts).
- the inverting input of another level detector of IC307, pin 6, to produce a left-right squarewave (DRIVER) opposite in phase to the one on pin 1 of IC307. This squarewave is used on the main board to boost up the supply voltage of the line power amplifiers during the second half of the horizontal scan (see further).

The parabolic signal from the multiplier, IC301 is buffered with Q302, clamped and buffered. The signal then goes to the non-inverting inputs of two voltage-followers in IC309(MC34084).

Obviously, the clamper Q310 shorts to ground the parabolic waveform, during the first half of the horizontal scan, and Q309 shorts the signal during the second half of scan.

The buffered signals are now adjusted in amplitude with IC311, IC312 and IC313 for the three colours. The outputs are summed and sent to the power amplifiers on a suitable level.

### b) At vertical frequency :

The vertical sawtooth "VDL" is DC coupled to a buffer IC308 pin 3 and then applied to :

- the multiplier IC302 to generate a vertical parabola.  
The parabola is inverted with Q304, clamped, buffered, and feeds two buffers in IC309.
- a level detector IC308 input, pin 5, to produce a top-bottom squarewave. The output is buffered and feeds the clamps Q311 / Q312 with a correct DC level for grounding the input at either the top or bottom half of the raster.

The two remaining potentiometers of IC311, IC312, IC313 are used to adjust the top / bottom waveforms which are again summed and leave the subunit to be amplified by the power amplifiers on the main board.

### c) Static or average focus (centre focus).

Three voltages **R STATIC , G STATIC and B STATIC**, adjustable between + / - 1.5 volts with potentiometers in IC303 are added to the feedback of the vertical focus power amplifiers.

### d) Power amplifiers :

#### 1. CORNER - H.

The left / right adjusted waveforms, summed on the subunit IC309 output, are now amplified to generate the required magnetic field for focusing of the beam during the horizontal scan. Because of the high scanning range, a good slew rate of these amplifiers is necessary. This is especially critical during the second part of the horizontal scan. This can be realised by boosting up the supply voltage during this time.

This boosting up of the +FOC voltage is got with the circuit around Q190 - 193. The squarewave drives the push-pull stage Q190/Q191, which on its turn drives the MOSFETs Q192 - Q193. The +FOC voltage is boosted up during the second part of the horizontal scan and is now referred to as **+V[DYN]**.

Three identical amplifier stages with feedback to the inverting input of the OPAMPS in IC100, deliver the required current to the horizontal focus coils.

#### 2. CORNER - V / STATIC.

Since the vertical scanning frequencies are much lower than the horizontal frequencies, a TDA2030 may be used. For stability reasons, a similar feedback voltage is applied on the inverting input, together with a DC-voltage (=static, for the centre).

R762271S

### B. Horizontal SHIFT

The +/- SHIFT voltages are not returned to chassis ground, but to the HDL (Horizontal Deflection Low, which is basically HTHD). Therefore, the adjusted shift voltages may not be referenced to chassis ground, but to the same HDL.

The digital potentiometer IC (IC52) has to be supplied with the +/- SHIFT voltages from the SMPS.

The I2C-bus lines SDA and SCL must drive the above-mentioned chip via an isolation circuit, using an opto-coupler.

The opto-coupler IC50 is used to isolate the SDA and SCL lines, referenced to a cold (chassis) ground, from the shift circuits in IC52.

The SCL pulses are sent to pin 1 of IC52 via an opto-coupler in IC50, whereas the SDA data line is connected with pin 2 through the other opto-coupler in IC50.

At the moment an "Acknowledgment" bit is returned to the Controller, another opto-coupler IC51 takes over. To avoid a return to IC52 via the first opto-coupler, MOSFETs are automatically switched on and off.

The HSI (Horizontal Scan Identification) information from one of the horizontal scan switches on the "Scan Switching" module, allows an inversion of the supply voltages for the multturn potentiometers P1 and P2. These potentiometers are the factory set *coarse alignments* of the shift, to be adjusted prior to the digital control.

The SHIFT voltages control an average DC current through the horizontal yoke windings in order to horizontally shift the rasters.

## Adjustment procedure

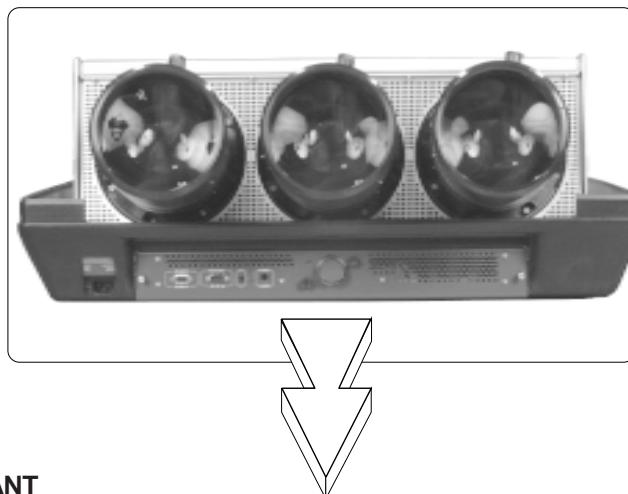

### Adjustments

### Location of adjustment controls

### Preparation

- Remove the unit from the projector housing. Insert the extension board and plug the unit on it. (refer to the sheet 'Service Kit' for installation of it)

#### IMPORTANT

- For all the adjustments on the module, the projector has to operate on a signal with the highest **used** line frequency.

# Convergence DRIVER module

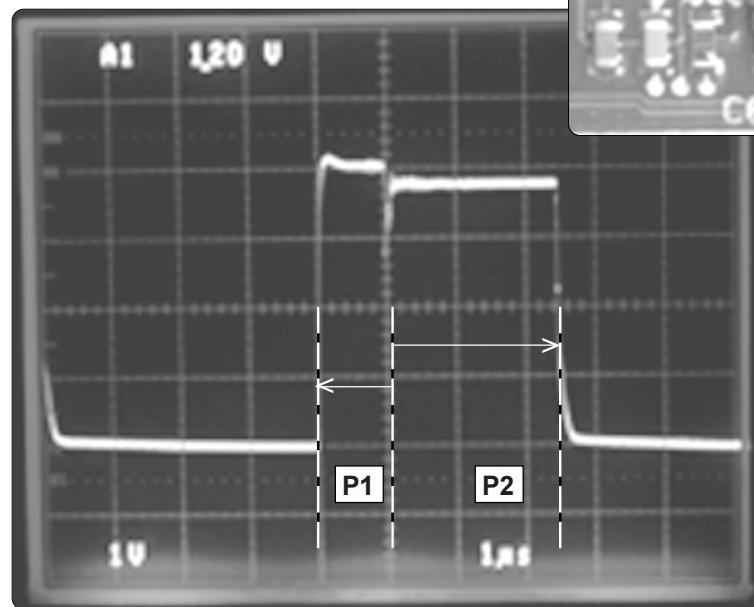

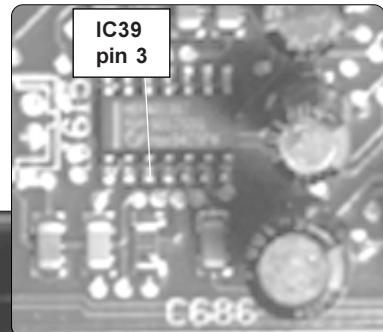

GREEN Convergence module

R762518  
R7625128

## Adjustment

### Adjustment of the pulse width PULSE 1 and PULSE 2

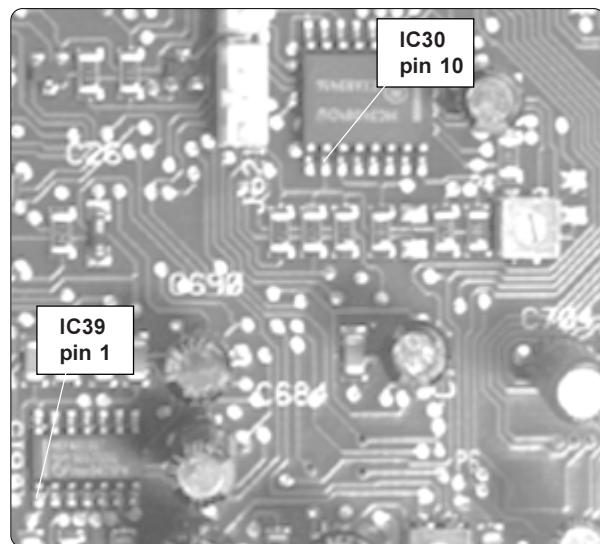

- Connect an oscilloscope to the pin 3 of the IC39.
- Adjust the potentiometer P1 for a pulse 1 duration of 1.0us.
- Adjust the potentiometer P2 for a pulse 2 duration of 2.5us.

### Adjustment of the potentiometers

P3: DC Offset switching level  
P4: Hor-Par/Vert-Sawt DC Offset  
P5: Clamping level Hor Parabola

*measurement points for the adjustments*

# Convergence DRIVER module

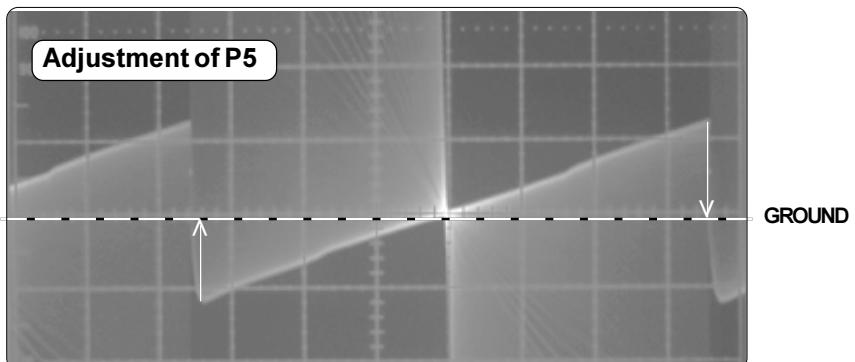

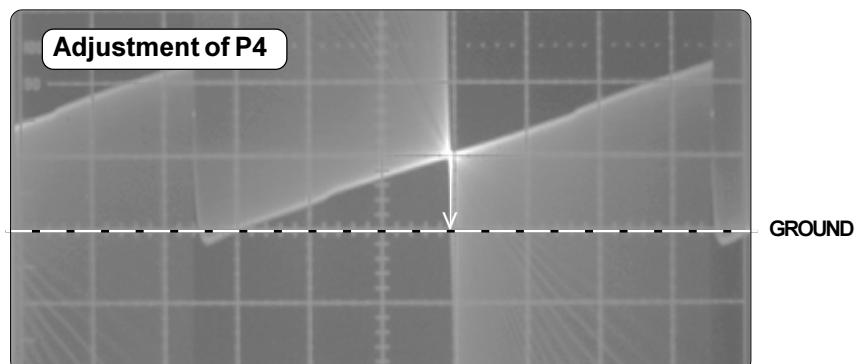

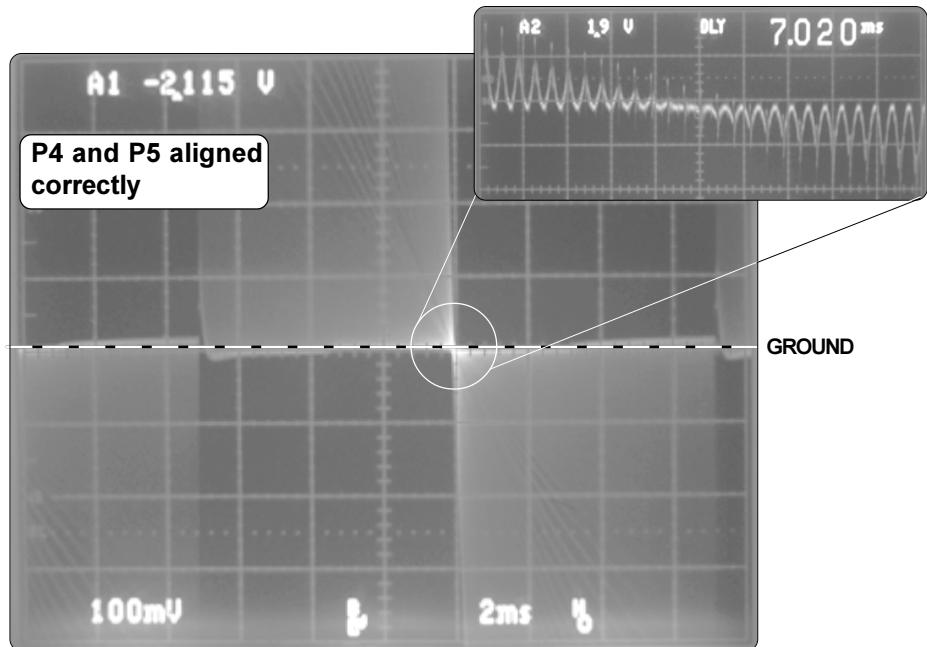

GREEN Convergence module

R762518  
R7625128

## Adjustment of the potentiometer

P4: Hor-Par/Vert-Sawt DC Offset  
P5: Clamping level Hor Parabola

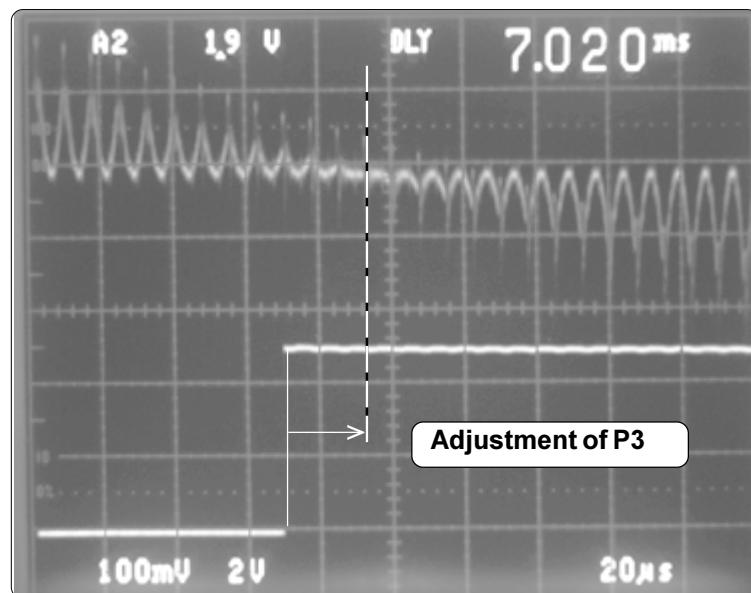

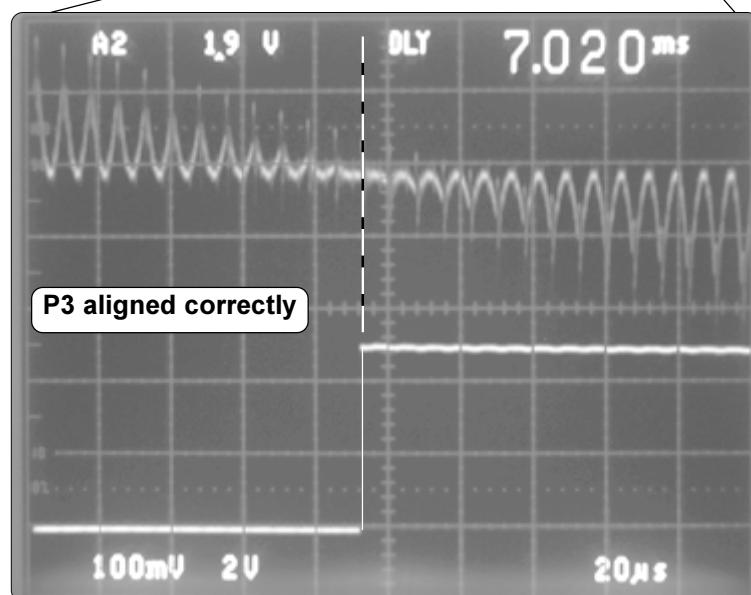

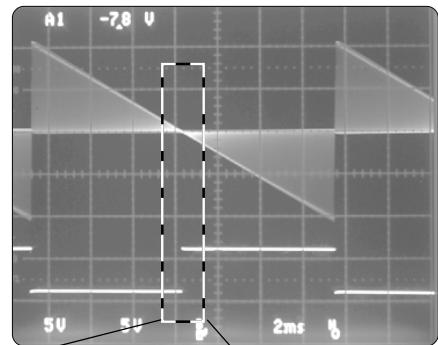

- Connect an oscilloscope to the pin 10 of the IC30.
- Adjust the potentiometer P4 until the DC Offset is at GROUND-level
- Adjust the potentiometer P5 until the clamping level of the Horizontal parabolas are at GROUND-level

## Adjustment of the potentiometers P3: DC Offset switching level

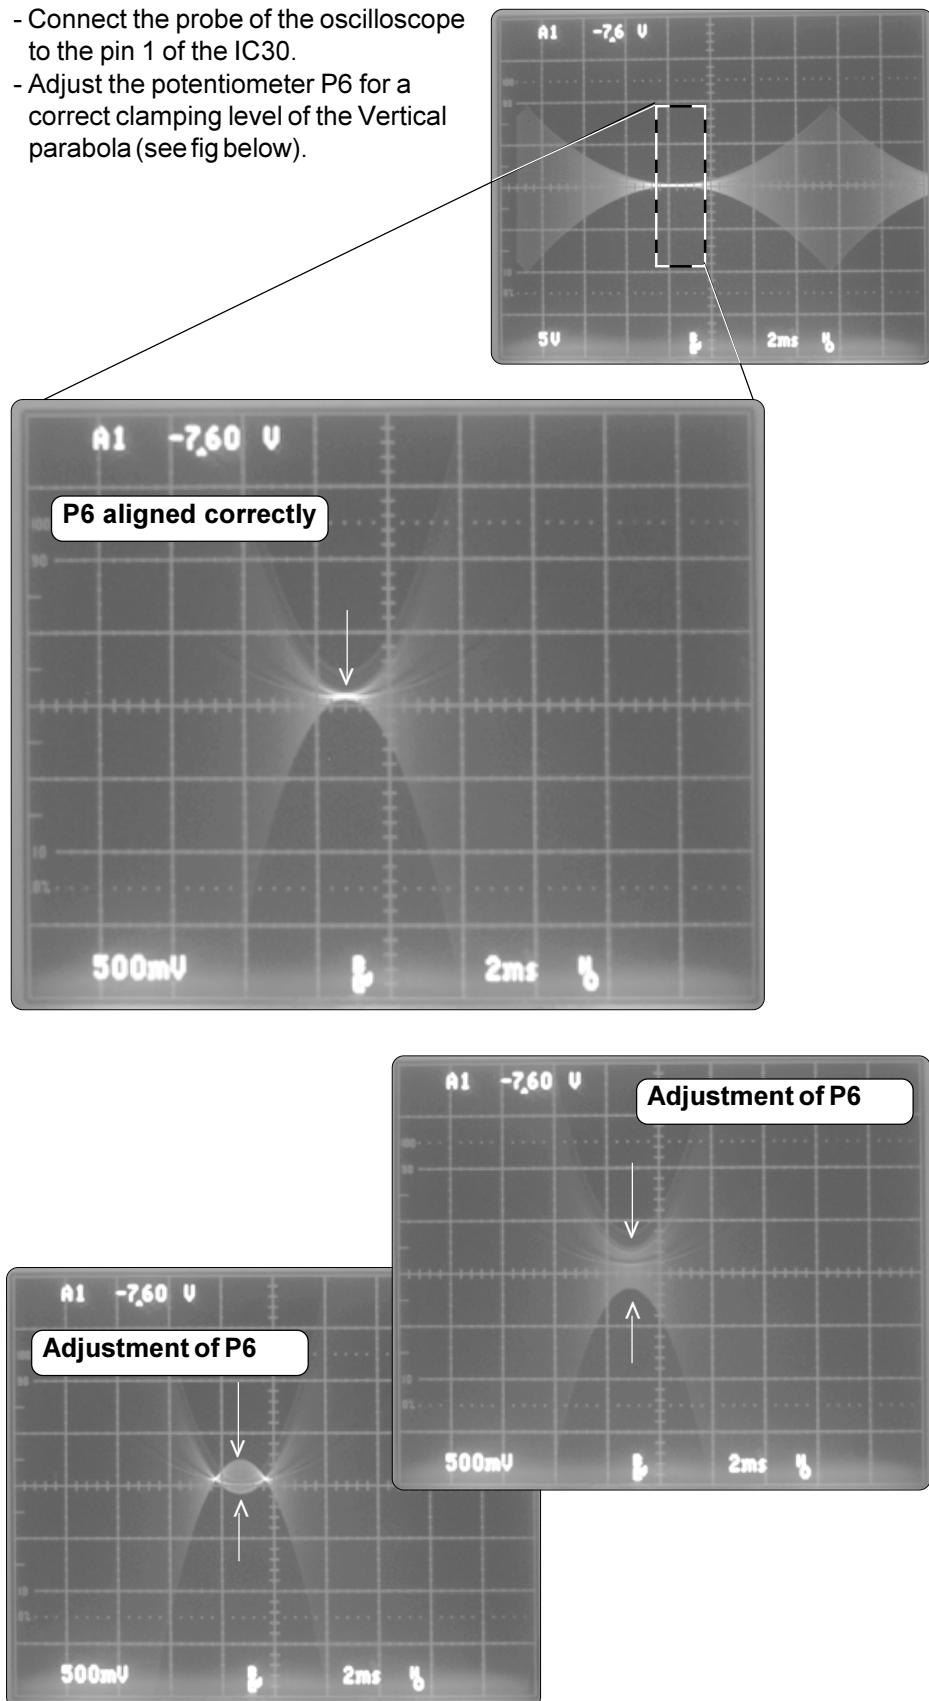

*Attention: be sure that the input signal for adjustment operates on the highest used line frequency.*

- Connect the second probe of the oscilloscope to the pin 1 of the IC39.
- Adjust the potentiometer P3 until the switching transient matches horizontal parabola inversion point.

## Adjustment of the potentiometer P6: Clamping level Vert Parabola

- Connect the probe of the oscilloscope to the pin 1 of the IC30.
- Adjust the potentiometer P6 for a correct clamping level of the Vertical parabola (see fig below).

## Technical description 'CONVERGENCE DRIVER' module R762518

### Introduction.

The Surface Mounted Devices (SMD) technology applied in the driver module makes servicing of the module not easy and requires the correct tools. The description of the schematics will then also be limited to the essential functions.

Two trigger pulses are generated to trigger the sawtooth generator and the dynamic boosting up of the power supply of the end stages. The sawtooth waveforms are clamped to ground level during one part of the scanning (left/right or top/bottom) and adjusted in amplitude for a linear correction on the scan for red and blue colour (except when the "convergence on green" option is mounted).

Multipliers produce parabolic waveforms which undergo the same kind of flow for the non linear corrections. A combination of the clamped signals, and a modulation on either a sawtooth or parabola is needed for the corner convergence. All the waveforms for one colour are summed with an OPAMP and amplified by a DC amplifier in the OUTPUT module.

### Trigger Pulse generation Pulse 1 and 2

The HDR\_CONV is speeded up and inverted with Q603. The negative pulse at the collector triggers at its negative going transient the monoflops IC9 and IC19.

#### Pulse 1: (trigger of the sawtooth generator).

The width of the positive output pulse at pin 13 of IC9 is adjusted with P1. The pulse train at the output pin 13 is integrated with R34/C620 and applied to one input (+) of the OPAMP IC15. It is obvious that the voltage across C620 is proportional with the width of the pulse and the line frequency. The output of this OPAMP determines the current of the current source Q9. This current adjusts the width of the pulse at the output pin 7 of IC19. The time constant of this one shot is designed to be a little less than the time period. That time constant needs to be tracked with the line frequency and this is realized as follows. The opposite polarity output pin 7 is integrated by R677 / C663 and applied to the inverting input of the same OPAMP.

The pulse at pin 7 (*Pulse 1*) starts consequently just before the end of the scanning and is used to trigger the horizontal sawtooth generator.

#### Pulse 2 : (dynamic boosting up power supply).

The pulse output at pin 13 triggers on the positive going transient the second monoflop in IC9. The width of the output pulse at pin 5 is adjusted with P2. Through the buffer Q5 the pulse is available for boosting up the supply voltage of the power end stages. Note that this pulse 2 is also added via D38 to pulse 1.

### Horizontal axis convergence :

#### Horizontal sawtooth generator. (Sheet 1)

C602 is charged up by the current source Q2. In order to stabilize the amplitude, irrelevant the line frequency, the charging current is tracked with the line frequency as follows. The sawtooth is buffered and an average value of the amplitude is obtained by integration with IC3 / C7 . The resulting output voltage adjusts the charging current of the current source Q2. The amplitude is set by the voltage at the other input of the OPAMP, thus by R2 / R602.

The sawtooth is inhibited by the clamper Q22 when the current consumption of the power end amplifiers is too big (see Power Output stages).

OPAMP IC3 (5-6-7) amplifies the sawtooth in order to supply IC4, IC16 and the multiplier IC20.

## Preparation of the waveforms.

The voltage comparator IC16 (5-6-7) transforms the sawtooth into a squared Horizontal 'Switch Pulse' of  $24\text{ V}_{\text{pp}}$  (+ / - 12V). This switch signal is used to clamp either the sawtooth or the parabola during the first or second half of the horizontal scanning. Note that the clipping level is variable with the voltage that drives the current source of the sawtooth generator. The multiplier IC20 (AD633) generates a horizontal parabola **HP+**

The next OPAMP shifts the DC level by clamping the middle of the parabola to a voltage adjusted by P5 (approx. 0 volts) in order to compensate the tolerances of the multiplier. The convergence at horizontal frequency with the ramp and parabola waveforms in the zones 11 - 14 are adjusted in IC1-IC2-IC601-IC602.

The waveforms are each time clamped with a clamping transistor served by the horizontal switch pulse. Two opposite phased waveform are each time applied to the potentiometers in the Bella's (digital potentiometer or D/A convertors).

<b>Vertical axis convergence</b>	<p>The vertical sawtooth generator is generated in a similar way as the horizontal sawtooth generator, discussed above. The much lower frequencies here allow the use of the MUXDMUX IC46 (4053) in stead of the clamps.</p> <p>The "Vertical Switch Pulse" is passed through the RS flip-flop IC39 which is clocked with the pulse 1 in order to make the transition coincide with the trigger or the start of the horizontal sawtooth. This avoids a jitter for interlaced signals.</p>
----------------------------------	---

<b>North-South / East-West and Midline corrections.</b>	<p>For these corrections we need horizontal waveforms with an amplitude depending on the vertical position or vertical scanning. The horizontal waveforms must be modulated on a vertical sawtooth or parabola. This modulation is performed by IC29 (MLT04). The four different waveforms are all applied to the "X" and "Y" inputs and the modulated waveforms are the "W1 - W4" pins.</p> <p>The corrections , called <b>GEOMETRY</b> corrections, are added to the CORNER and AXIS corrections in the "Summing Amplifiers".</p>
---	---

## East - West corrections :

Two kind of corrections (referred to as "skew" and "bow") are required to correct the projection angle and aberrations of the optical system.

The HSVS (Horizontal Sawtooth modulated on a Vertical Sawtooth) and HSVP are used for this purpose.

The HSVS is first amplified with an OPAMP in IC30 and then clamped with Q11 and Q10 which are 'served' with the "R" and "S" switching signals. The *LS+* and *LS-* (Left Skew) and *RS+ / RS-* (Right Skew) are fed to two digital potentiometers in IC13 and the adjusted outputs are sent simultaneously to the three convergence coils.

HSVP is first inverted and amplified and then clamped during the first or second half of the scan. The *RB+/-* and *LB+/-* are applied to the digital potentiometers in the same IC13 and the outputs also feed the three convergence coils.

## North - South Corrections .

Two type of waveforms are modulated on a vertical sawtooth VS, Horizontal Sawtooth (HS) and Horizontal Parabola (HP).The HSVS from IC29 (sheet 3) is capacitively coupled to the MUX DMUX IC46 (sheet 2) and in stead of clamping, the signal it is

switched with the "vertical switch pulse" for a split of top and bottom. The TK (Top Keystone) and BK (Bottom Keystone) signals are adjusted in IC14. Since there is a correction per colour the different outputs of the digital potentiometers are gathered per colour and will be added to the other corrections in the "summing amplifiers".

## Midline Corrections.

For the vertical and horizontal midline skew and bow corrections, the non-modulated waveforms HP- / + , HS+ / - are adjusted in amplitude with IC42 and simultaneously applied to the vertical and horizontal convergence coils of the three crt's.

## **Corner convergence.**

The four corners are further divided (split) into 4 zones. The generation of the convergence signals for the corners is similar for these four corners. The only difference is the clamping or switching period. A split top / bottom is realised with a MUXDMUX switcher and a left / right split with fast switching clamping transistors.

We limit the explanation to one corner and one zone (**Zone 1**).

Zone 1 is the cross section of the extreme left vertical axis and the extreme top horizontal axis. We need to start with a Horizontal Parabola (=extreme left vertical axis) modulated on Vertical Parabola (= extreme top horizontal axis). This signal is called *HPVP'* in sheet 5. The clamping transistor Q16 clamps this signal during the second half of the horizontal scan and then the signal is called *Z1+Z20*. This signal is now split into top / bottom (*Z1* and *Z20*) by the MUXDMUX IC12 (see sheet 4). *Z1* and *Z20* are now prepared for the digital potentiometer IC35 by the buffer - OPAMP IC37 to get *Z1+* and *Z1-* (same signal with opposite polarity). These signals are then adjusted in IC35 and used for red and blue. The outputs are added in the summing amplifier to the rest of the corrections. (*Geometry and Axis*).

## Summing amplifiers.

All the corrections for the horizontal convergence coils are added per colour and amplified with an MC34081. These OPAMP's are supplied with +/- 12V and since the non-inverting input is at ground level, the average output of these OPAMPS is around zero volts. This is required by the output power amplifiers for a balanced load of the (complementary) output stage.

## Technical description " CONVERGENCE OUT" 762519

The purpose of the power amplifiers is to bring the adjusted signals to a sufficient high level that the convergence coils can be fully driven. Important hereby is that the drift must be kept as low as possible and that the signals must be carried to the coils without using coupling capacitors.

It is obvious that the coils react differently on signals at a high (line) frequency than on low frequency signals. Much more power is required for the high scanning than for the low scanning range. The power supply +/- CONV for these power amplifiers is a variable line frequency tracked voltage delivered by the "G2 + Diagnostic" board.

Six identical amplifiers feed the six convergence coils, two for each picture tube. We'll discuss only the amplifier served with "*RHin*" (Red Horizontal).

*Note that "Horizontal" here relates to the moving direction (of lines of a crosshatch pattern) and not to the "horizontal" frequency. The "RHin" signal contains waveforms at line and vertical frequency.*

*That's also the reason why the amplifier stages are identical.*

The signal is first passed to the non-inverting input of an OPAMP MC34082, the inverting input receives a feedback signal from the output. The purpose of this stage is to stabilise the overall gain (DC and AC) of the amplifier.

The output of the OPAMP drives an inverting amplifier Q1 with high frequency compensation in the emitter.

The input signal to the OPAMP is around zero level, Q1 is therefore supplied with +12V and -CONV. The same applies for the next amplifier Q3.

This next MOSFET is supplied from the dynamic +COND supply line through a variable (line frequency tracked) current generator Q2, and, from the -CONV.

This dynamic voltage is the +/- CON voltage boosted up during the "pulse 2" time. By this increased supply voltage the slew rate during the horizontal retrace time is considerably improved. The end result is a better behaviour of the convergence coils just after the retrace time, thus, in the beginning of the scan.

The dropped voltage across R12 / P1 / R13 is partially applied to the base-emitter multiplier Q5 to provide sufficient voltage to drive Q4 / Q6 push-pull output stage. The zeners just limit the gate - source voltage for protection.

The current flow from the +/- CONV is preferable symmetrical. If for some reason one of the supplies is requiring more current than the other supply, the feedback system can no more correct the situation. It is possible that the problem is caused by a lack of symmetry of a pre-driver stage.

Further heating of an output that could lead to a breakdown might be avoided by inhibiting the sawtooth generator (see schematic "Horizontal Axis Convergence", sheet 1)

The electronic circuit that generates the *llim* is represented on sheet 2 of the "CONV OUT" schematic.

The current taken from the + CON' develops a voltage across SR1 that is applied to the base of Q20. The current taken from the - CON' does the same for Q21. As soon Q21 is switched on, the *llim* turns on Q22 (See sheet 1 of Horizontal Axis CONV) and the sawtooth generator is inhibited.

## TECHNICAL DESCRIPTION " DYNAMIC ASTIGMATISM " 762514

The waveforms for the dynamic astigmatism are parabolic and resemble the waveforms for the convergence corrections. It is then logic that the adjusted waveforms in the Bella's are delivered by, and coming from, the convergence driver board.

These waveforms are carried to the module via the connectors J6 / J7 / J8. These connectors carry the split (clamped) parabolic waveforms at horizontal and vertical frequency and opposite polarity.

Each correction consists of an orthogonal spot correction (\*X) and a diagonal spot correction (\*Y). To facilitate the correction a separate centre or 'screen axis' and corner 'screen corners' is provided.

In sheet 1 of the schematics you find the 12 Bella's for these corrections. As the waveforms have opposite polarity, the supply voltages for these Bella's is +3.2V and -1.8V taken from the convergence board.

The "corner" and "axis" corrections are added per colour and then passed onto the power amplifiers. These power amplifiers are fully integrated hybrid amplifiers supplied with + / - DYN.

The supply voltage for these amplifiers is **+30V** (+ DYN) and **-17V** (- DYN). Each time the output current flows in 150 Ohm damping resistor across the stigmator coils and a series feedback resistor of 4.7 Ohm. The voltage developed across this resistor is sent back to the inverting input of the amplifier for stability reasons.

Note that the jumpers J3 and J4 can be removed in order to isolate the power stages of the astigmatism and thus to investigate whether an excess of load on the supply voltages of the whole convergence board is caused by one of these amplifiers (or caused by another power amplifier of this convergence module).

# SM POWER SUPPLY+StBy SUB MODULE

7621065  
762106S

**TECHNICAL DESCRIPTION SWITCHED MODE POWER SUPPLY (7621065).**

**Introduction.**

On the main board of this module we find the generation of all stable voltages , we mean voltages independent on the line frequency, and the variable +HTHD voltage (referred to as the second SMPS).

This second SMPS is linked via the subunit with the horizontal deflection board as the +HTHD voltage (horizontal scan voltage) is linearly proportional with the line frequency.

Because the 'second' SMPS utilizes the rectified voltage from the winding P22-P24, this SMPS totally depends on the 'first' one' , or in other words, if the first SMPS is down , the second one 'follows' .

The ON/OFF voltage delivered by the controller board can stop or start up these Switched Mode Power Supplies.

The subunit comprises the DC-fan control, the regulation circuit for the +HTHD, its Under- and Over voltage protection circuits, the +17volts drop protection and the stand-by power supply.

**Generation of the line frequency independent voltages.**

The mains voltage is rectified on the Mains Filter unit (76 2114) and the +300 volts is now the supply voltage for the power switches Q100 and Q101 on the main board.

We assume that the thyristor TIC106C is conducting (its gate is not clamped at ground level, see later).

The positive halfwave of the mains voltage (START) charges C102 via D104 . The gate of the thyristor is set at 11 volts with the zener Z100 through R101 from the +300volts.

As soon as the capacitor voltage of C102 reaches approximately 12 volts, the IC can start up by driving the base of the power switch.

The diode D104 stops conducting as its anode is at about (11 + 0.6) volts.

The thyristor gets blocked as well, because its cathode equals the gate voltage.

In the meantime the IC102 has started up and the voltage at pin 9 receives its supply voltage now from the winding 24-22 of the T2 transformer via D109.

The push-pull outputs, pins 7 and 8, drive the Q101 power switch and during the off time of the latter the accumulated energy in the primary winding is transferred to the secondary capacitors via the rectifying diodes (flyback principle).

The feedback winding 21-22 provides two informations for the control IC :

**Firstly**, the waveform is sent to pin 2 where the **zero passages** are detected, useful to drive the power switch on at the exact moment.

The base drive is delayed until the energy in the transformer has been com-

pletely transferred to the secondary side. By this measure, the current through the power switch is reduced to a minimum.

**Secondly**, the negative amplitude is rectified by D111 and compared with the reference 4 volts that is available at pin 1.

The error voltage is now sent to pin 3 and serves as a control voltage to adjust the duty cycle and frequency of the switcher.

The same windings also serves as a help at starting up. This windings provides energy the moment the P22-P24 winding does not. The rectified voltage passes to pin 9 up to the moment that pin has reached 12volts.

The current through the power switch is at all times checked and if too high (in the event of a short on the secondary side) the comparator 393 (IC101) output drops the error voltage in order to adapt the duty cycle of the switcher.

Note that a "special" winding is provided, delivering **+17M**, or, a voltage related to the **Mains** ground and not the chassis ground. This voltage is utilized on the EHT board, because the drive circuit for the power switcher is Mains ground and not Chassis ground. (see description EHT board).

### Generation of the +HTHD voltage (scan voltage).

This voltage is linked with the horizontal deflection board as it has to be adapted to the scanning frequency. A feedback voltage (FBHD) is for that reason arriving on the subunit.

This feedback voltage, at contact J4(7) of the subunit, is sent to the base of the error amplifier Q6. The potentiometer P2 allows an adjustment of this feedback, or in other words, the horizontal width can be aligned with P2.

The emitter of Q6 is set at a reference zener voltage, adjustable with the voltage at the regulating pin of Z8. This voltage is the result of the output of the DC-amplifier-buffer 353, combined with the +HTHD voltage.

By this measure, we reduce the range of the horizontal width at high scanning frequencies. Indeed, at standard video frequency we need much more range to overscan.

The collector current of the regulating transistor Q6 flows into the opto-coupler IC5 and the phototransistor of this insulating device is now regulating the DC voltage at pin 3 of IC100, in order to stabilize the +HTHD voltage for one typical line frequency and amplitude setting.

Q7 is a 5mA current generator and D10 a **green** LED to visualise the +HTHD voltage.

### Overvoltage protection.

Pin 2 of the 393 (IC4) is set at 5.6 volts with Z10 and, the other input, pin 3 is the scan voltage divided by R38/R39.

As soon this input exceeds the zener voltage, the output switches high and saturates transistor Q9. The +HTHD voltage is dropped to a low level.

The original overvoltage protection is now causing an under voltage protection.

# SM POWER SUPPLY+StBy

## SUB MODULE

7621065  
762106S

### **Under voltage protection.**

The stabilized zener voltage with Z8 is used as reference voltage for the comparator 393, pin 6. Now, the other pin 5 is the +HTHD voltage.

If the pin 5 drops below the reference voltage, the output switches low, and the transistor Q8 saturates, pulling again pin 2 of IC5 low.

### **Protection against too low +17 volts.**

If, for some reasons, the +17 volts (and all the other voltages as well) are, even temporarily, too low, it is then advised to shutdown the +HTHD voltage (coming from the other SMPS).

Pin 6 is preadjusted, ex factory, at approx. 14 volts with P1

This happens with the comparator in IC3 and its output pin 7 saturates again Q8.

### **Temporary shut down at switching.**

The "DEFL" info from the HOR DEFL board can switch on Q10 via Q11 and also pull down pin 2 of IC5. This is necessary the moment the relays switch the two windings of the scan coils from series to parallel or vice versa.

### **Stand-by / ON-OFF switch-ing.**

An oscillator is built up around Q1/Q2 and the transformer T1.

Q1 gets its base current via R3. The collector current of the latter flows in the winding 1-3 and induces a voltage in the winding 5-4 'encouraging' the base current.

As soon the emitter voltage of Q1 can drive the Q2 and saturate it, this transistor clamps the base of Q1 at ground level and cuts off Q1. The cycle starts all-over again.

Two opposite polarity SB voltages (+/- 9 volts) are available at the secondary side.

#### **a) Stand-by mode (OFF).**

The voltage at contact 3 of the J4 connector ('OFF') is in this case 'high' and this means for the optocoupler IC1 that the phototransistor is not conducting.

Q3 is thus saturated as R6 can provide the required base-emitter current.

The collector of Q3 is 'low'. Furthermore, pin 5 of IC102 is below its "active level" via the diode D105 disabling the drive output.

As a conclusion, only the standby voltages +/- 9 SB voltages are available.

#### **b) Operational mode (ON).**

The I/O block of the controller board ( collector of a transistor) pulls now contact 3 of J4 at a low level to light the LED in the opto-coupler IC1.

Now, the phototransistor of the latter is saturated and brings the base of Q3 at nearly

### DC Fan control of the fans.

ground level. This means now for this transistor an OFF state. The zener Z100 on the motherboard can now install +11 volts at the gate of the thyristor allowing the charge of the capacitor C102.

The speed of the fans is regulated by means of a sensor (NTC resistor) mounted close to the heatsink of the SMPS board.

IC2 is an integrated circuit regulating the speed of the fans by adapting the duty cycle of the output drive for the power transistor Q4. L1 and C7 filters the output voltage.

The feedback is applied to pin 5 which is protected against arcing with D4/D5.

MC34063 is a switching regulator. An oscillator trimmed with C6 is applied together with a dc voltage to an RS-flipflop via an AND gate. That DC voltage now is the result of a comparator output receiving an internal reference voltage of 1.25 volts and the feedback voltage at pin 5 (comp). Consequently, the duty cycle depends on the DC voltage that is built up as follows :

- it is determined by the output voltage via R13 / R14 / R11 in order to stabilize the latter for a well-determined value of the NTC resistor.
- it is equally influenced by any change of the NTC resistor itself, sensing the heatsink of the SMPS board.

The minimum voltage is set by Z5 at approximately 7.5 volts and the maximum speed by Z4 + Z4. at 15 volts.

The maximum current output is limited by R10, and an RC feedback straight from the output to pin 5 provides a more regular speed at any time.

### Power supply for the EHT generator.

The EHT generator is supplied directly from the rectified mains voltage. The +300M volts is leaving the board at the contacts 31/32 of the J8A connector for the EHT board (see description of that board)

By above measure, we eliminate the influence of the EHT load on the performance of the power supply, and the maximum peak current of the EHT generator is increased.

762106S

## IMPORTANT

The SM POWER SUPPLY has to be adjusted when the projector displays a picture of the internal generated testpattern or of an input signal at standard line- and frame frequency.

## PREPARATION

Select the internal generated test pattern or an input source at standard frequency (refer to owner's and installation manual).

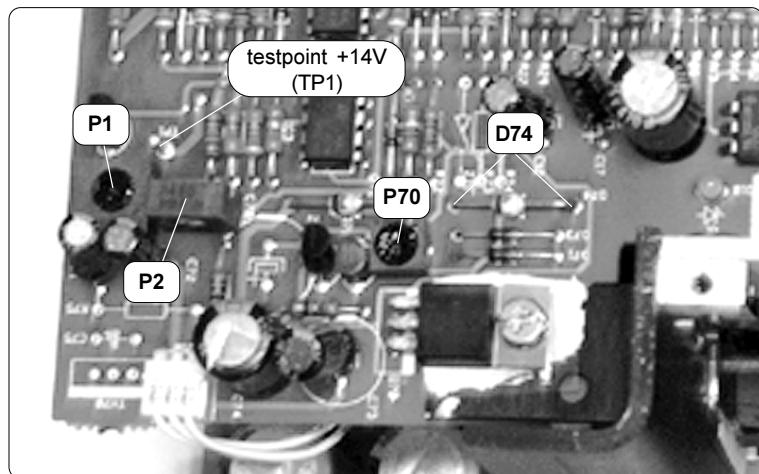

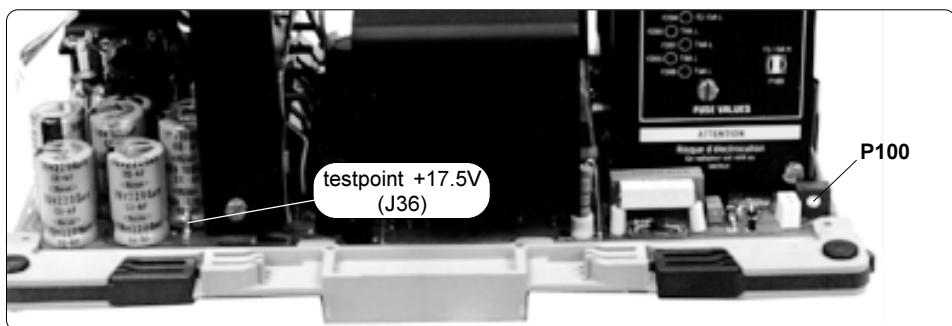

Put the BRIGHTNESS and CONTRAST level in mid-position (refer to owner's manual).  
**ADJUSTMENTS**

Adjustment on main board

### a) Adjusting Vout P100

Connect a voltmeter to the provided test point (+17.5V).  
Adjust potentiometer P100 for +17.5V on testpoint.

Adjustments on sub-board

### b) Adjusting +14V P1

**Important:** P1 is factory pre-adjusted. A readjustment is only necessary after a replacement of a defective component in the +17V drop circuit.

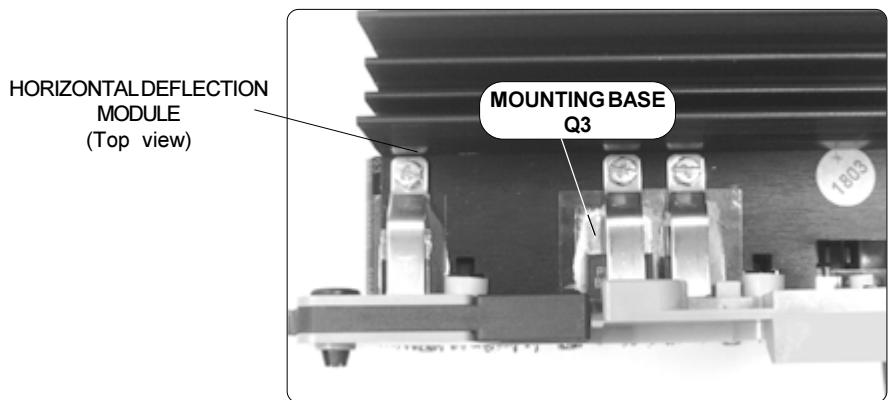

Adjustment procedure: Connect a voltmeter to the testpoint TP1.  
Adjust potentiometer P1 for +14V on that TP1.

**c) Adjusting MAX HOR AMPL P2**

Adjust the Horizontal Amplitude of the displayed picture by means of the RCU800 on its maximum (bar scale on screen indicates 99). (Refer to the owner's manual to select the corresponding menu).

Connect a voltmeter to the collector (Collector connected to mounting base) of transistor Q3 (BDV65C) on the Hor. Defl. board.

Adjust potentiometer P2 for +48V (HTHD) on collector.

**d) Adjusting picture heater voltage P70**

Adjust potentiometer P70 for +6.75V across diode D74.

## Input power (mains) voltage adaptation.

### Attention

The BV 1609 - R90002070/R90002071 leaves the factory to operate on a power (mains) input of 230 Vac.

The BV 1609 - R90002079/R90002078 leaves the factory to operate on a power (mains) input of 120 Vac.

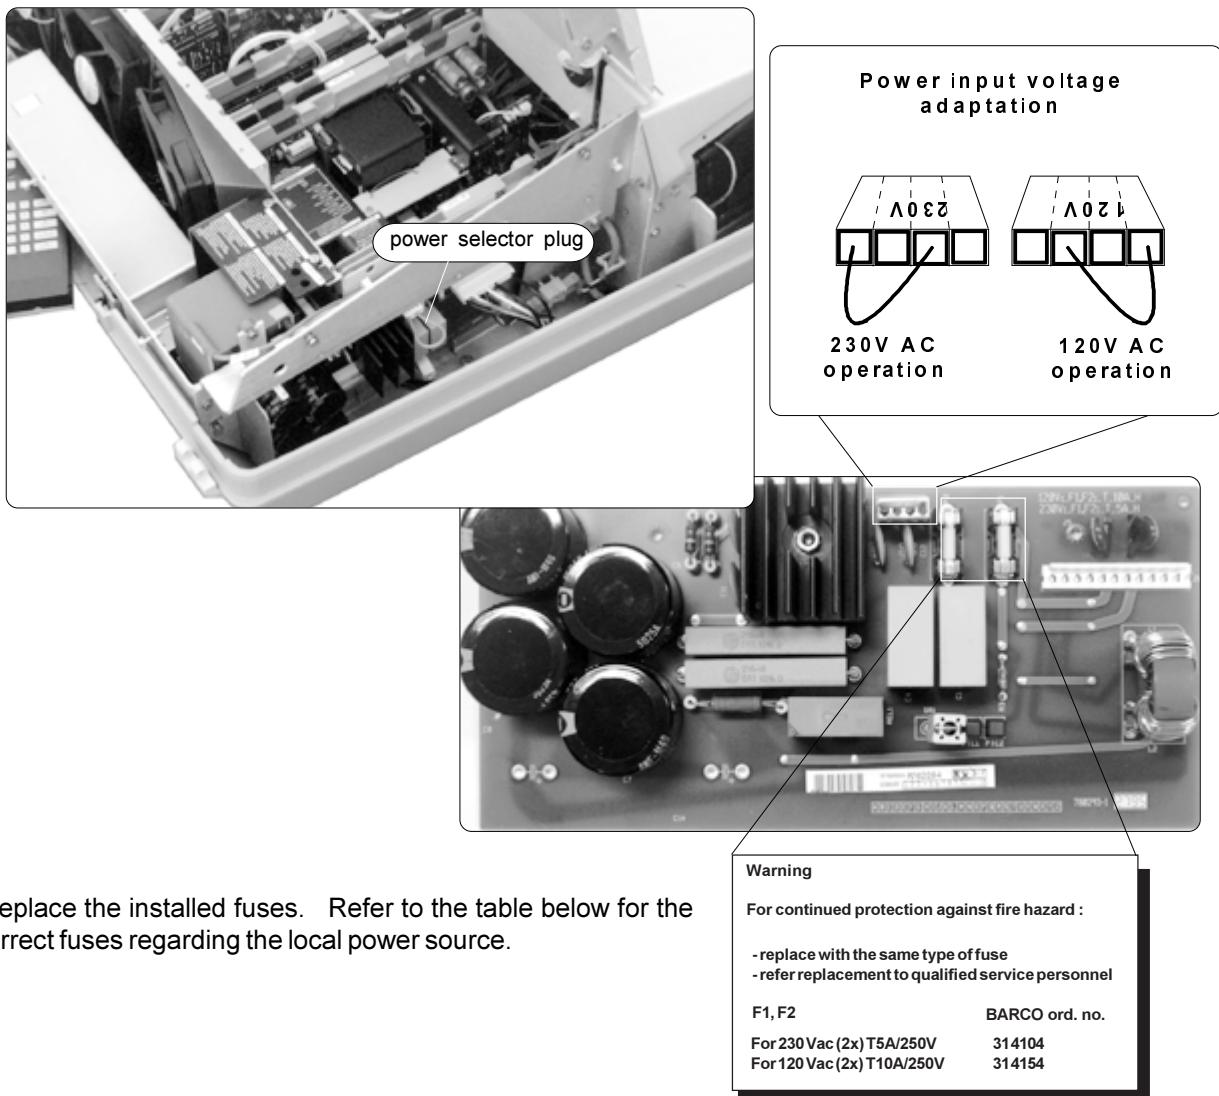

Adaptation of the power input of the projector to the local power source, from 230 VAC to 120 VAC or vice versa, is possible. Follow the procedure as described below.

### WARNING

This circuit board is hot to AC. This Power input does not use a line isolation transformer, meaning the circuitry is HOT-TO-LINE and should be treated with caution.

### Procedure

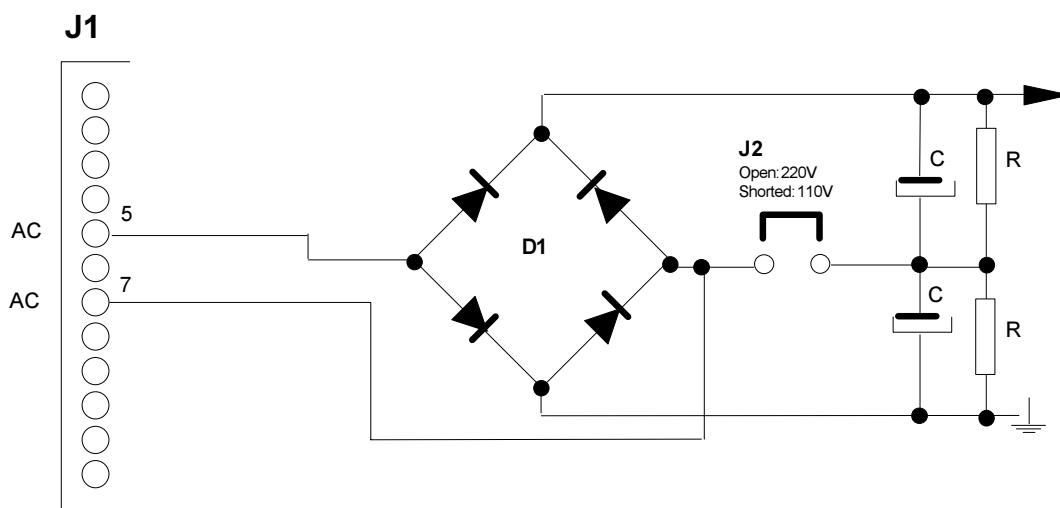

1. To be quite on the safety side, make sure the power cord is unplugged;
2. Open the top cover (see § Getting access to the controls of the installation manual).
3. Pull out the 'power selector plug' and re-insert it as illustrated in the drawing below, depending on the power source in the room.

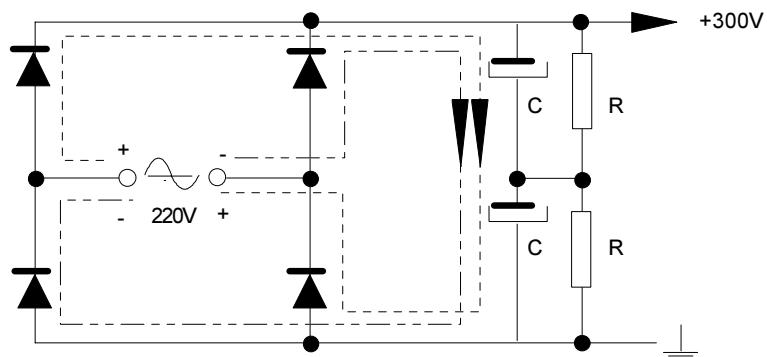

4. Replace the installed fuses. Refer to the table below for the correct fuses regarding the local power source.

# Power (mains) input module

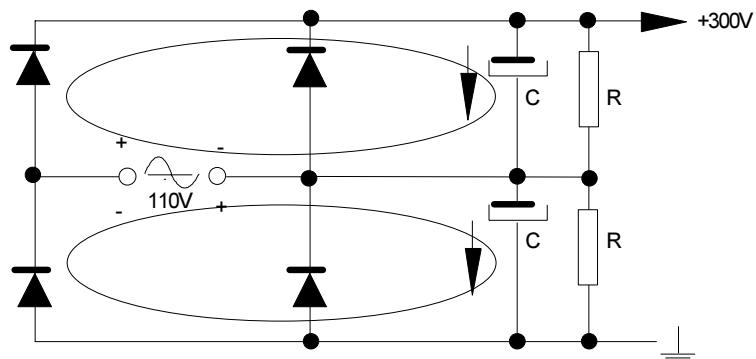

R762284

**Power input voltage 230V**

**Power input voltage 120V**

### PRODUCT SAFETY NOTICE

Components identified by have SPECIAL CHARACTERISTICS IMPORTANT TO SAFETY. Before replacing any of these components, read carefully the service safety precautions.

**WARNING**

**THIS CIRCUIT BOARD IS HOT TO AC. THIS POWER SUPPLY, LIKE THE HIGH VOLTAGE POWER SUPPLY, DOES NOT USE A LINE ISOLATION TRANSFORMER, MEANING A PORTION OF THE CIRCUITRY IS HOT-TO-LINE AND SHOULD BE TREATED WITH CAUTION.**

## SAFETY PRECAUTION

### SWITCHING TRANSISTOR Q12 REMOVAL/REPLACEMENT

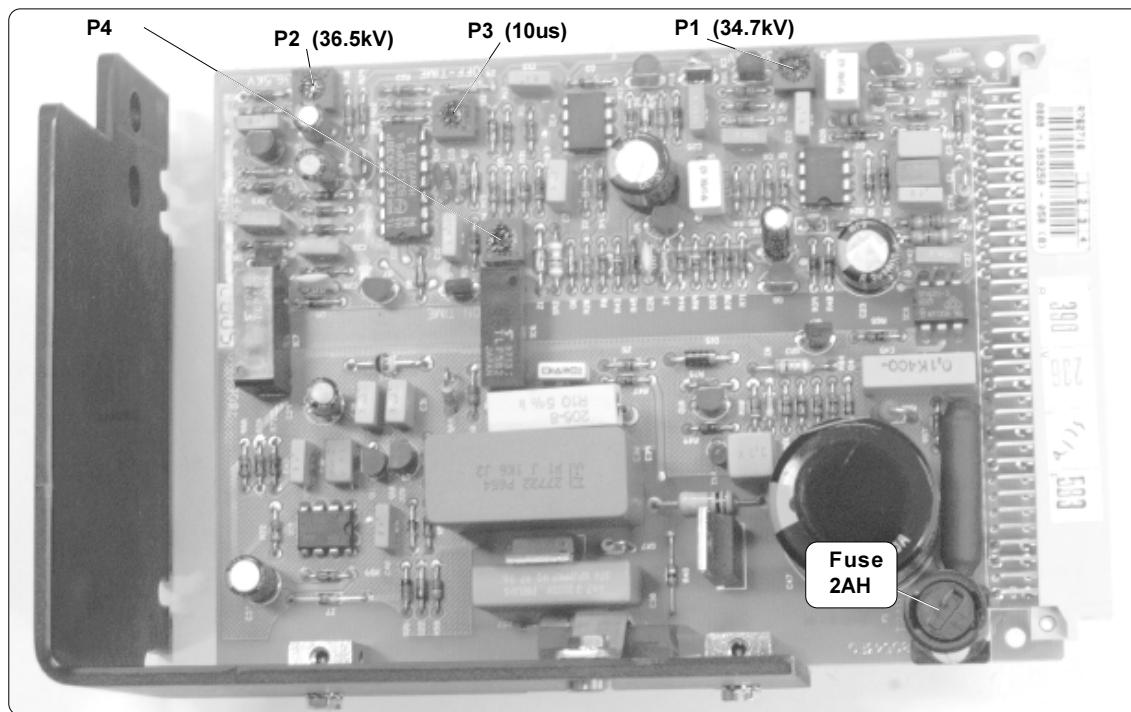

RE-INSTALL ALWAYS THE INSULATING DEVICE BETWEEN THE SWITCHING TRANSISTOR Q12 AND THE HEATSINK AND THE TRANSISTOR CLAMP.

PROCEED TO A LEAKAGE CURRENT HOT CHECK AS DESCRIBED IN THE SAFETY NOTICES

## HIGH VOLTAGE WARNING

To avoid DANGER TO LIFE, do not attempt to service the chassis until all precautions necessary for working on HIGH VOLTAGE equipment have been observed. In order to prevent damage to solid state devices, do not arc pix tube anode lead to chassis or earth ground.

### Preparation

**Warning:** The power must be OFF before removing any connector from circuit board or unit. Failure to do so may result in severe damage to the projection unit.

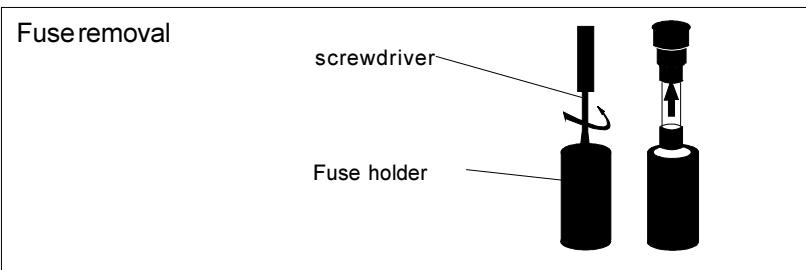

- Turn the projector off.
- Put the potentiometers P1 and P2 in their minimum position (turning clockwise!!)
- Pull out one CRT-EHT cable of the EHT splitter.
- Insert in the free EHT connector the **precision EHTprobe** (ratio 1000/1).

**Warning:** read carefully all safety instructions, mentionned in the user's manual of the precision high voltage probe

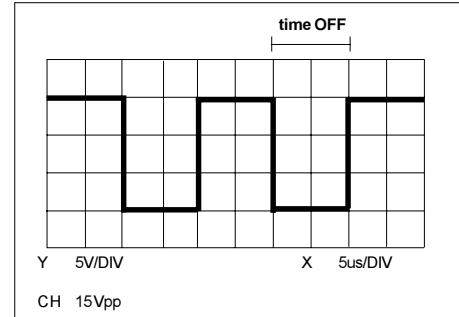

### Adjustment

#### P3 Switching transistor time OFF

- Remove fuse "F-2A" out of fuseholder (see illustration "Fuse removal")

- Connect the oscilloscope to the resistor R47 (=gate switching transistor Q12)
- Switch on the projector.
- Adjust potentiometer P3 for a drive pulse 'time OFF' width of 6.2 us.

**P1 High Voltage Adj.** - Switch off the projector

**P2 Hold Down** - Put the fuse 2A in its place.

- Switch on the projector

- Adjust potentiometer P1 "High Voltage Adj." until the EHT voltage reaches 36.5kV.

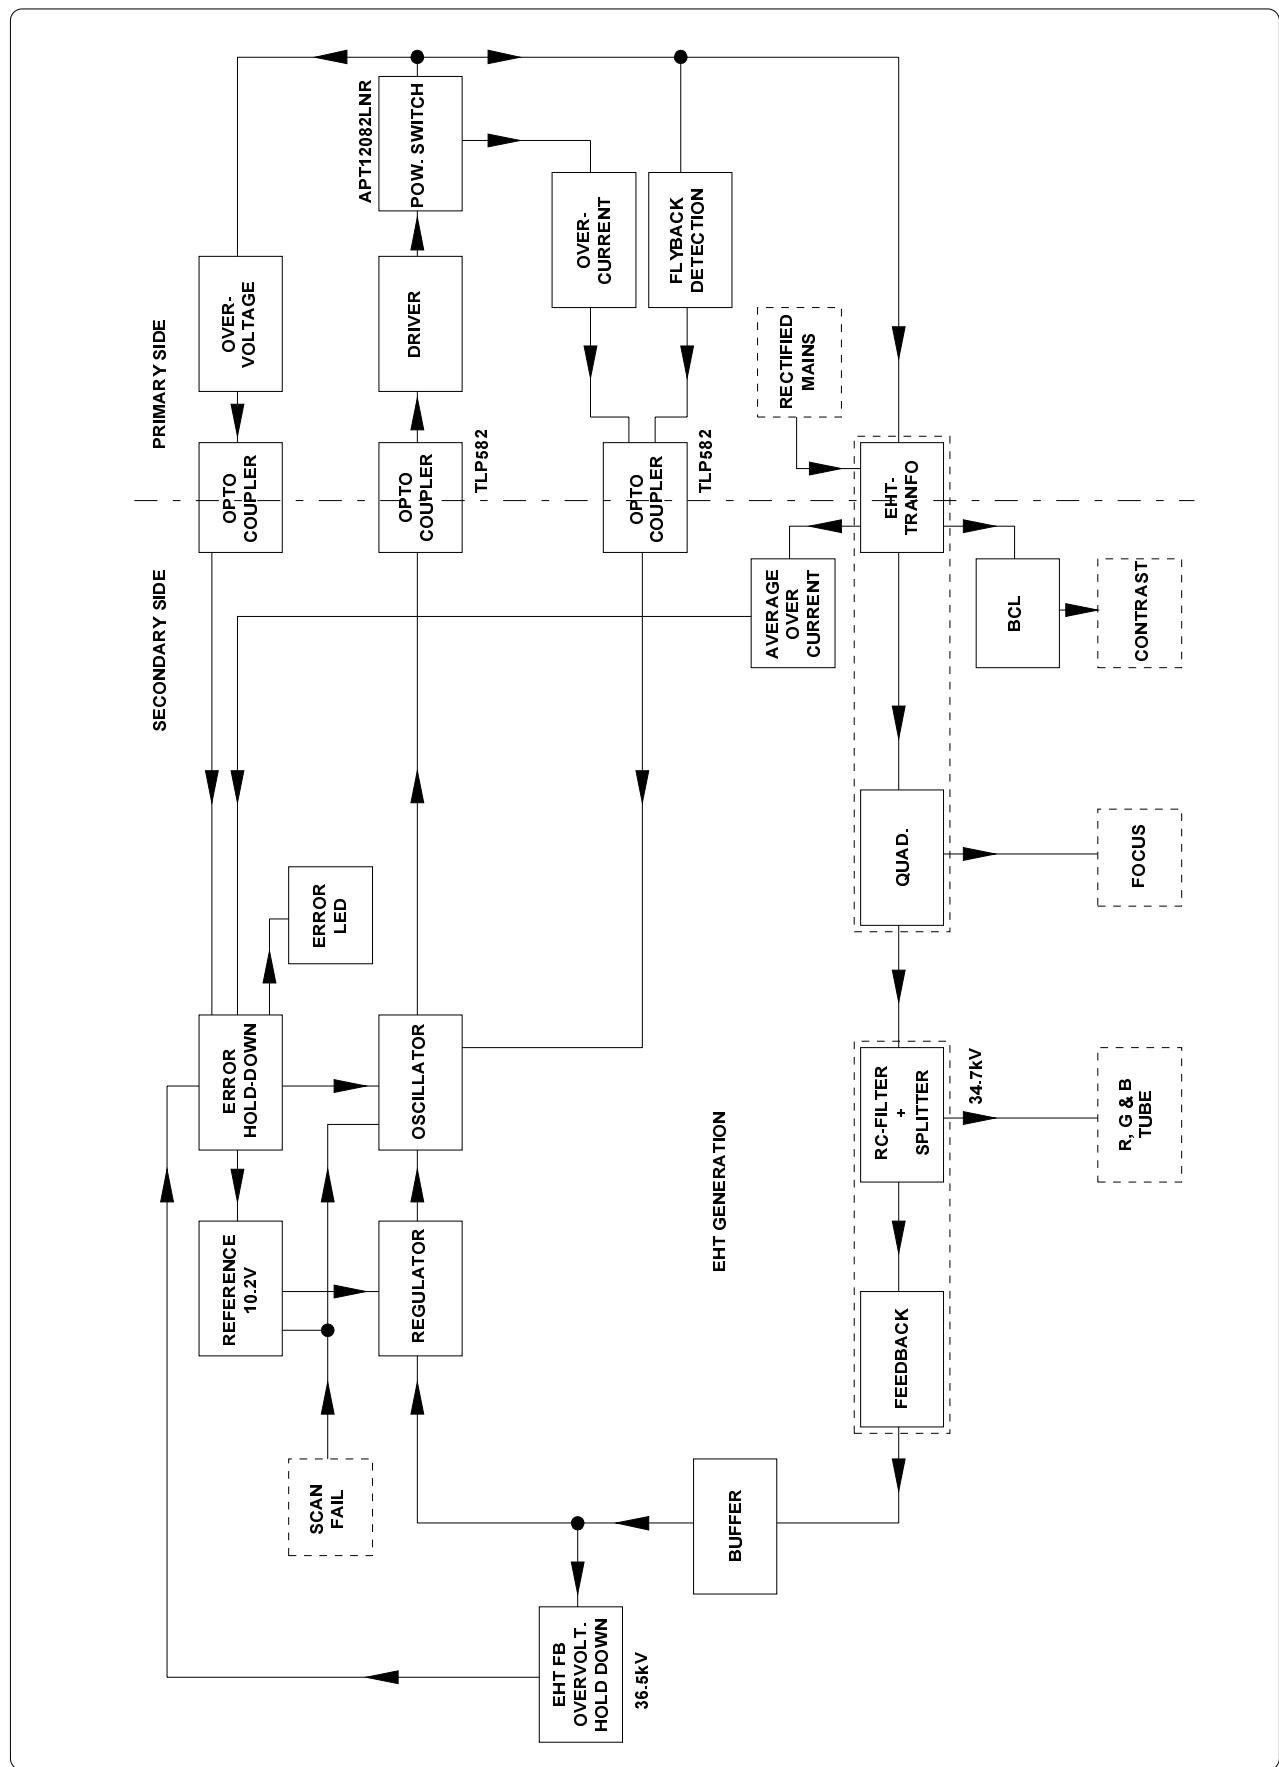

- Turn potentiometer P2 "Hold Down" until the Hold Down LED D13 lights up. The projector switches at that moment into the Hold Down mode, picture disappears.

- Put the potentiometer P1 again in its minimum position (turning counter clockwise!!).

- Turn the power switch in its OFF position (not-pressed) and switch on the projector again (press the power switch).

- Adjust the potentiometer P1 for an EHT voltage of 34.7kV.

**Important:** The EHTsplitter, on which a potentiometer is mounted, leaves the factory as a factory pre-adjusted unit. A readjustment of the mentioned potentiometer is in no case allowed.

## Technical Description EHT module R762716

### Introduction

On this board, the EHT drive pulses for the EHT power supply are generated. The primary circuit for the EHT power supply receives its 300VDC supply from the Mains. In the event of a failure, either because the EHT is too high, too much current in the EHT circuit or a horizontal or vertical scan failure condition exists, the EHT voltage is discontinued.

We will discuss the generation of the EHT pulses, its regulation, and, the different protection circuits.

### DC controlled multivibrator

The EHT multivibrator is set up around two Schmidt Trigger NAND gates in IC2. The frequency of this oscillator is typically around 100 kHz. Two time constants are involved in this circuit : C14 / P3 + R22 and in the feedback loop C15 / (R21 + P4 / (R12+R13)) voltage regulated.

The first time constant is invariable and determines the OFF time of the power switch Q12 and is tuned with P3 to 6.2 µS. The second time constant is variable and depends on the voltage level of IC4 (pin1.) By a change of the bias voltage on the base of transistor Q2, this time constant can be regulated.

The buffer receives at its base the FBHV voltage (feedback voltage from the divider). This is the EHT voltage divided by a factor 1000 on the splitter. The pin 5 of IC3 is set at a reference of approximately +10.2 volts by zener IC1. The duty cycle or the on/off time of the power switcher Q12 is consequently regulated by the voltage difference detected by the regulator circuit.

The squared waveform at pin 4 of the NAND gate is, via a fast switching and inverting FET Q1, sent to the opto-coupler IC6. This opto-coupler is necessary because the remainder of the circuit is supplied with the +17M' and the +300M which are not isolated from the Mains. The +17M voltage is obtained from a special winding on the SMPS and the +300M is the rectified mains voltage (GNDM is mains or hot ground).

**Caution: Any servicing on a board that uses both a Mains Ground and a Chassis ground should involve the use of an Isolation Transformer, especially when using an oscilloscope, or other equipment connected to the main AC source. Do not connect the Main and Chassis Ground together at any time.**

As this board is supplied with the +300M as soon the Mains switch is pushed, it is not recommended to remove this board any more even when the projector is in a stand-by position. This can damage the contacts of the board.

The output of the opto-coupler IC6 drives the push-pull stage Q10/Q11. The pulses are capacitively coupled with C32 to the gate of Q12. The 20 volts zener Z5 has two purposes.

The negative level of the pulses is clamped at -0.6 volt, and on the other hand the gate-source voltage is limited (protected) to 20 volt DC, in order to protect the switcher Q12.

The drain (DHV) of the power switcher is connected with the primary winding of the EHT transformer. Transformer and quadrupler are in the same unit.

The +300M enters the board and is passing a filter L1/C47 and a fuse before it supplies the Transformer / Quadrupler unit.

## Protections

### a) EHT Hold down:

The EHT of the projector must be switched off in the event of a failure in the regulating circuit or an absence of the feedback voltage. Moreover, when the current in one or more tubes is excessively high (leaking of a tube), the projector must be switched off via the EHT Hold Down rather than via the main switch. As the spot suppression does not work, the CRTs could be damaged when switched off via the main switch.

#### 1. EHT Hold Down due to fault in the regulating circuit (FBHV too high)

The slider voltage of P2 ("hold down adjust" potentiometer) is sent to the base of Q5 and its emitter is set at a threshold of 5.6 volt by Z3. As soon the EHT rises beyond 36.5kV, transistor Q5 starts conducting, turning on Q6. The collector of Q6 starts to drive the base of Q7 and this in turn stops the EHT multivibrator from oscillating, therefore halting the EHT. The collector of Q6 is placing the base of Q5 high hence the combination is locked down until the projector is powered off to reset the circuit.

#### 2. EHT Hold Down due to a feedback loop fault condition

The EHT hold down protection must also operate when there is an "open loop", or no EHT feedback voltage +FBHV from the splitter. If that were the condition, there would be no way to monitor the EHT, and it could go higher than the 36.5kV, since there is no FBHV voltage available. Another reason is that the maximum voltage on the MOSFET switcher is limited to 1150V as well. The detection for "open loop" is built around the EHT "flyback" pulses taken from the drain of Q12.

These pulses are rectified with D17 and the resulting pulsating DC is filtered by C39, divided down with R53/R60+R75 and applied to the base of Q16. A threshold level of 6.2 volt is installed at the emitter with Z8. From 6.8 volt base voltage onwards Q16 starts conducting, turning fully on Q17. In the LED of the opto-coupler there is small current flow from the +300M through R66. When Q17 gets forward biased, this current increases heavily and the output pin 5 drops. Via the forward biased Z4, the collector of Q5 is lowered and Q6 is turned on introducing the EHT HOLD DOWN .

Note that the same opto-coupler and transistor Q9 are used to remove the influence of the hum on the +300M supply via the feedback voltage. The +300M is, via a filter C45+R66/R67, supplying current to the opto-coupler (pin 1 of IC8.) The voltage , containing this mains hum, is taken from the collector of Q9 and capacitively added to the reference voltage.

#### 3. EHT Hold Down in the event of an excessive amount of CRT beam currents

Finally, in the event of an excessive amount of CRT beam current, the negative HVL voltage can charge up C23 to the -0.6V threshold and Q8 conducts to introduce the EHT HOLD DOWN condition. The delay is determined by the time constant ((R40//R39+NTC1)/C23) and the amplitude of the HVL voltage. Note that a beam current proportional voltage (BCL) is also sent to the RGB-Decoder drive board to reduce the contrast and brightness from some level onwards.

As a summary, the EHT Hold Down is active for :

- too high EHT, information coming from the feedback line FBHV
- too high EHT in "open loop" via Q16/Q17 and the opto-coupler IC8.
- too high beam current lasting for some time (short in a crt).

**b) Switching off the EHT when a Horizontal or Vertical scan failure occurs.**

In the event of a horizontal and/or vertical scan failure, the SF line is dropped to around zero volt. Q2 is blocked generating a low level on pin 11 of IC2 resulting in a switching off of the oscillator (IC2.) The reference will also become zero volts through Q3 and Q4.

When the scan fail line goes high again prior to switching off the projector, C18 has to charge up first. This prevent oscillations and further delays the action of the slow start circuit R30-C19 combination. When Q3 switches off C19 charges up, the resultant is a slow start up of the reference

**c) Over current protection of the Q12 switcher.**

The drain-source current of Q12 is measured by the resistor R54 in the source. This voltage developed across the sensing resistor is applied to the comparator IC9 (pin 2) via a divider R55/R56.

The purpose of the circuit is to protect Q12 from over current during a arc.

**Slow start up of the EHT**

When the projector is switched on, the EHT voltage must gradually be built up to prevent mechanical damage of the gun.

The reference voltage grows slowly because of the delay circuit around the base Q4. As soon the feedback voltage would like to rise above the reference voltage, pin 7 (IC3) is falling via R20-D6 and the oscillator is switched off temporary. When pin 5 of IC3 goes higher than the feedback the oscillator restarts, causing a increase in EHT. Consequently, the EHT rises to its maximum in a staircase manner.

When the unit is switched off, C19 is quickly discharged via Q3, taking the EHT reference voltage for IC1 quickly down, and therefore the EHT itself goes down.

<b>Delay of the power switch drive</b>	Fet IC9 the comparator pin 7 is used to keep a drive pulse from driving Q12, until the EHT pulse on the drain of Q12 has not fully dropped to its minimum. The EHT pulse is coupled to the comparator and opto-coupler holding the oscillator down during the flyback pulse, on the drain of Q12. As soon as the flyback pulse is over then a drive pulse is resumed on the gate of Q12. This prevents driving the power switch Q12 the moment the drain has not yet dropped to a minimum.

## PRODUCT SAFETY NOTICE

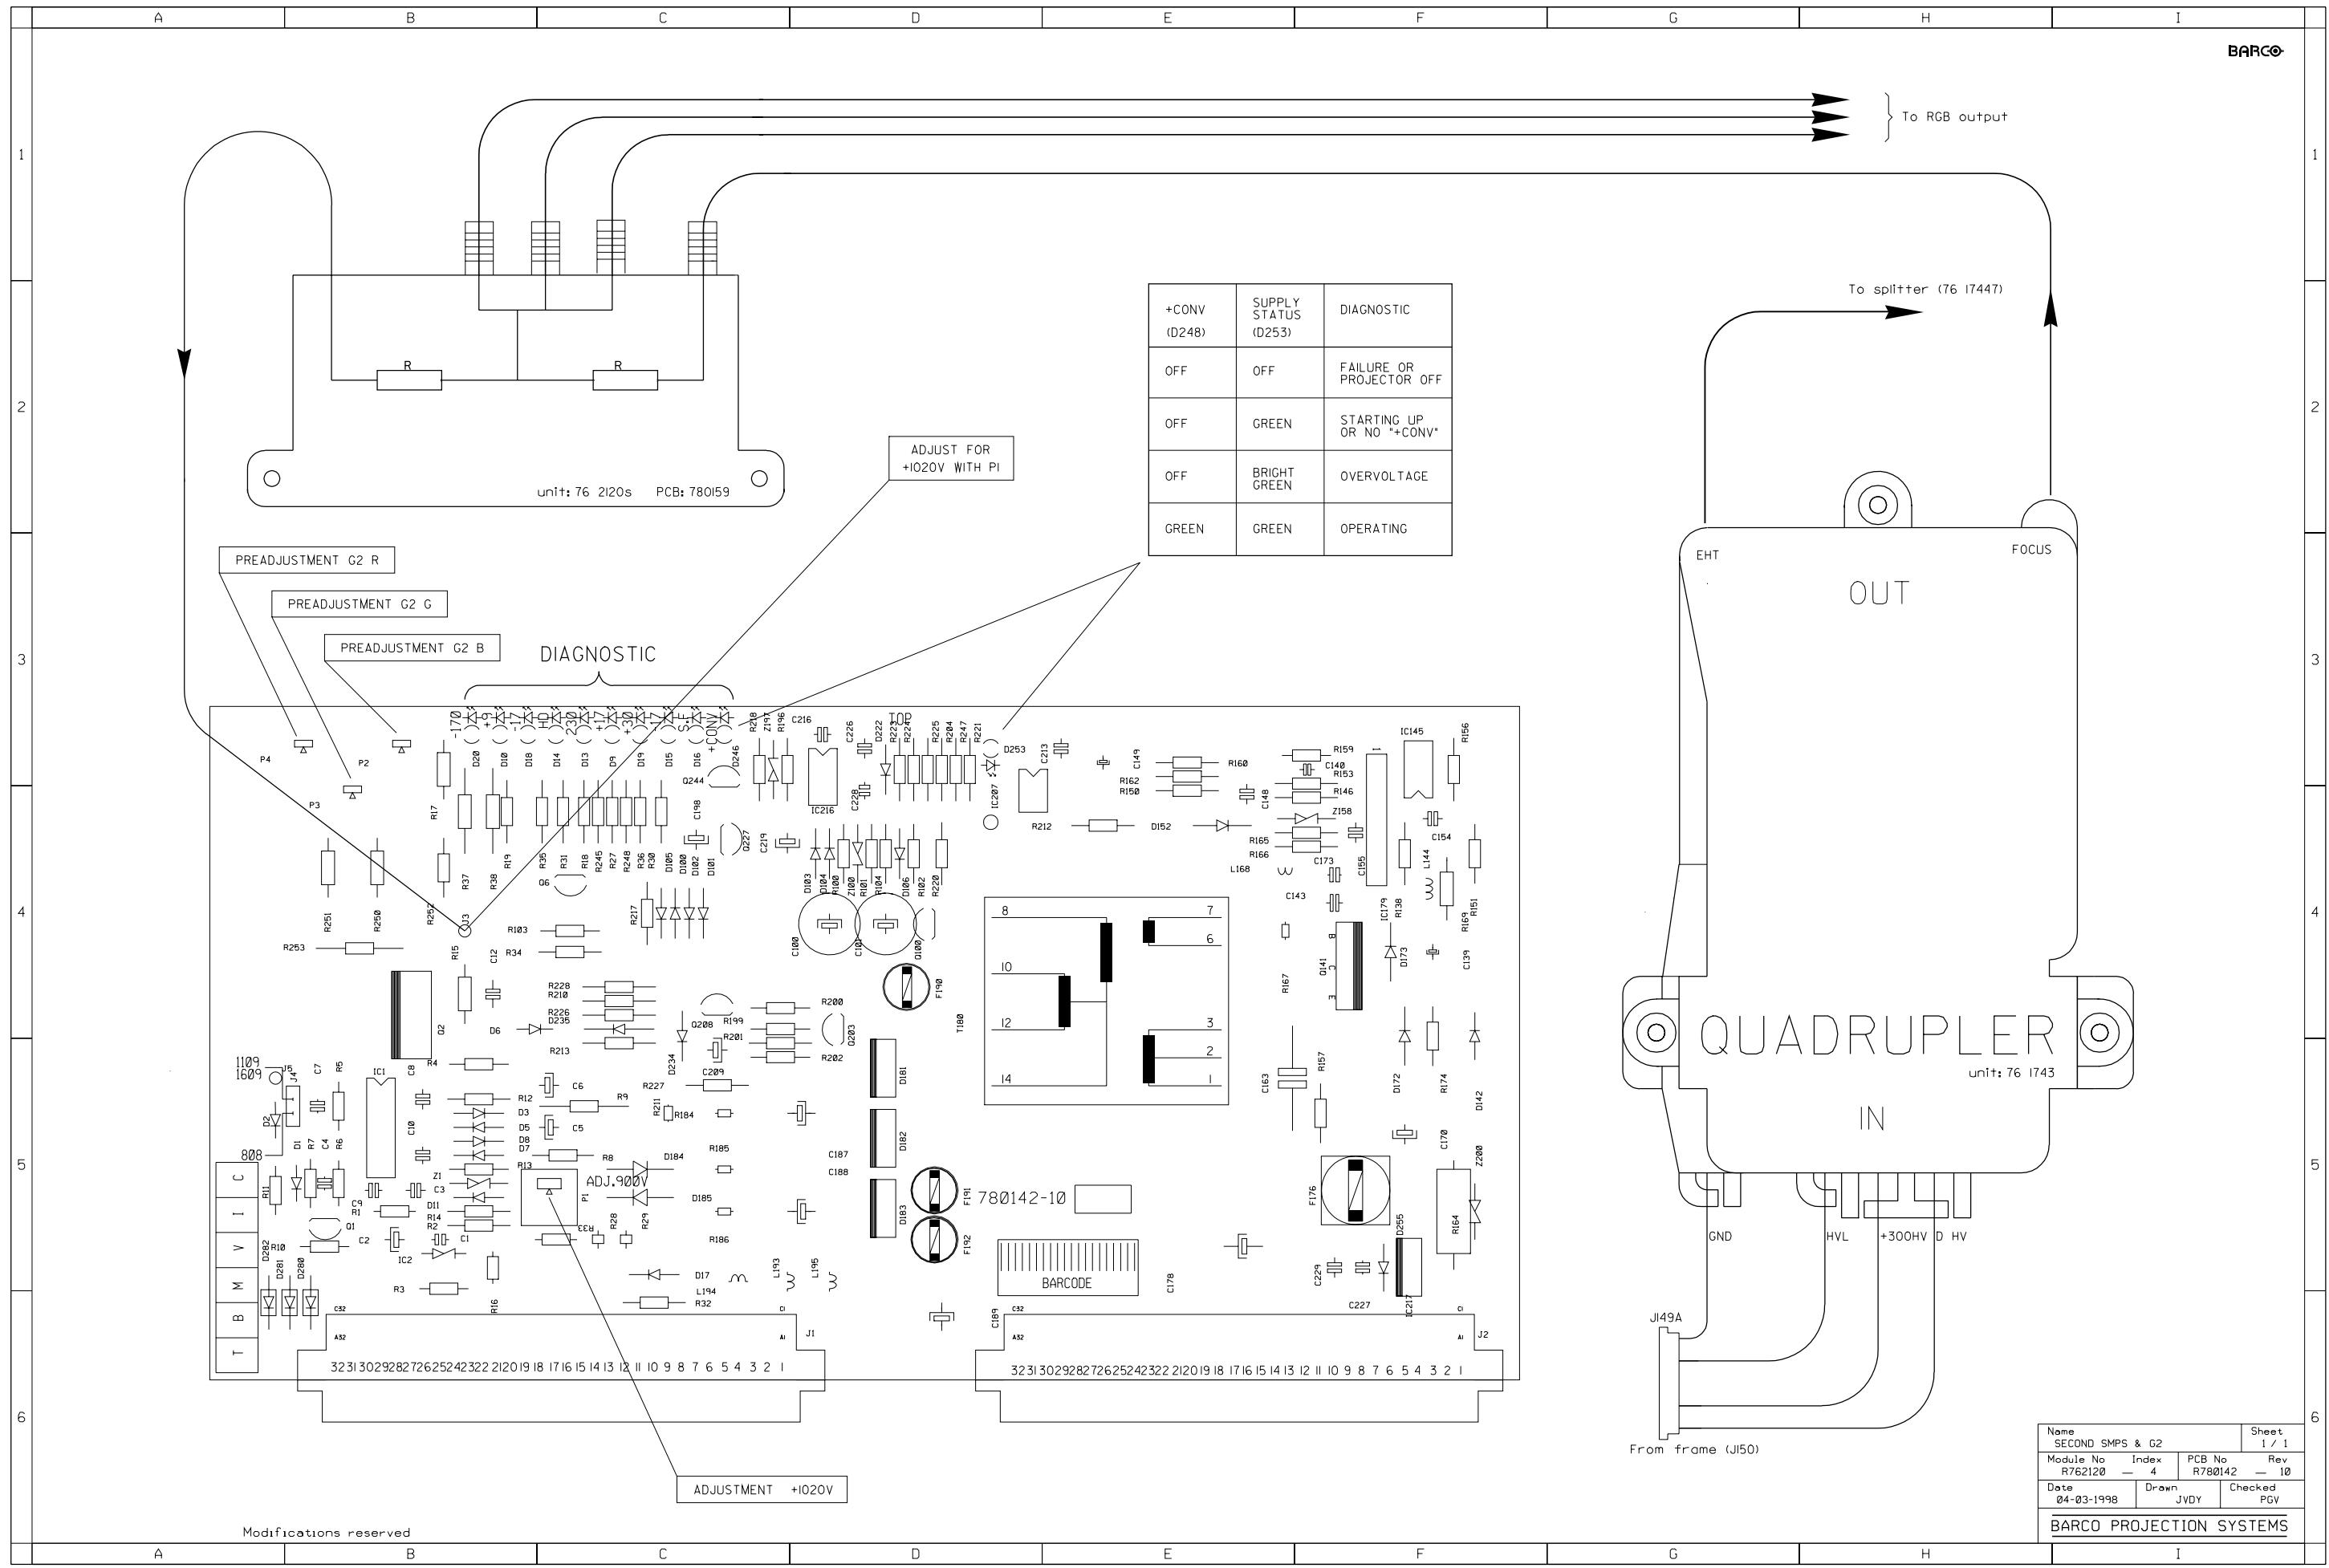

Components identified by  have SPECIAL CHARACTERISTICS IMPORTANT TO SAFETY. Before replacing any of these components, read carefully the service safety precautions.

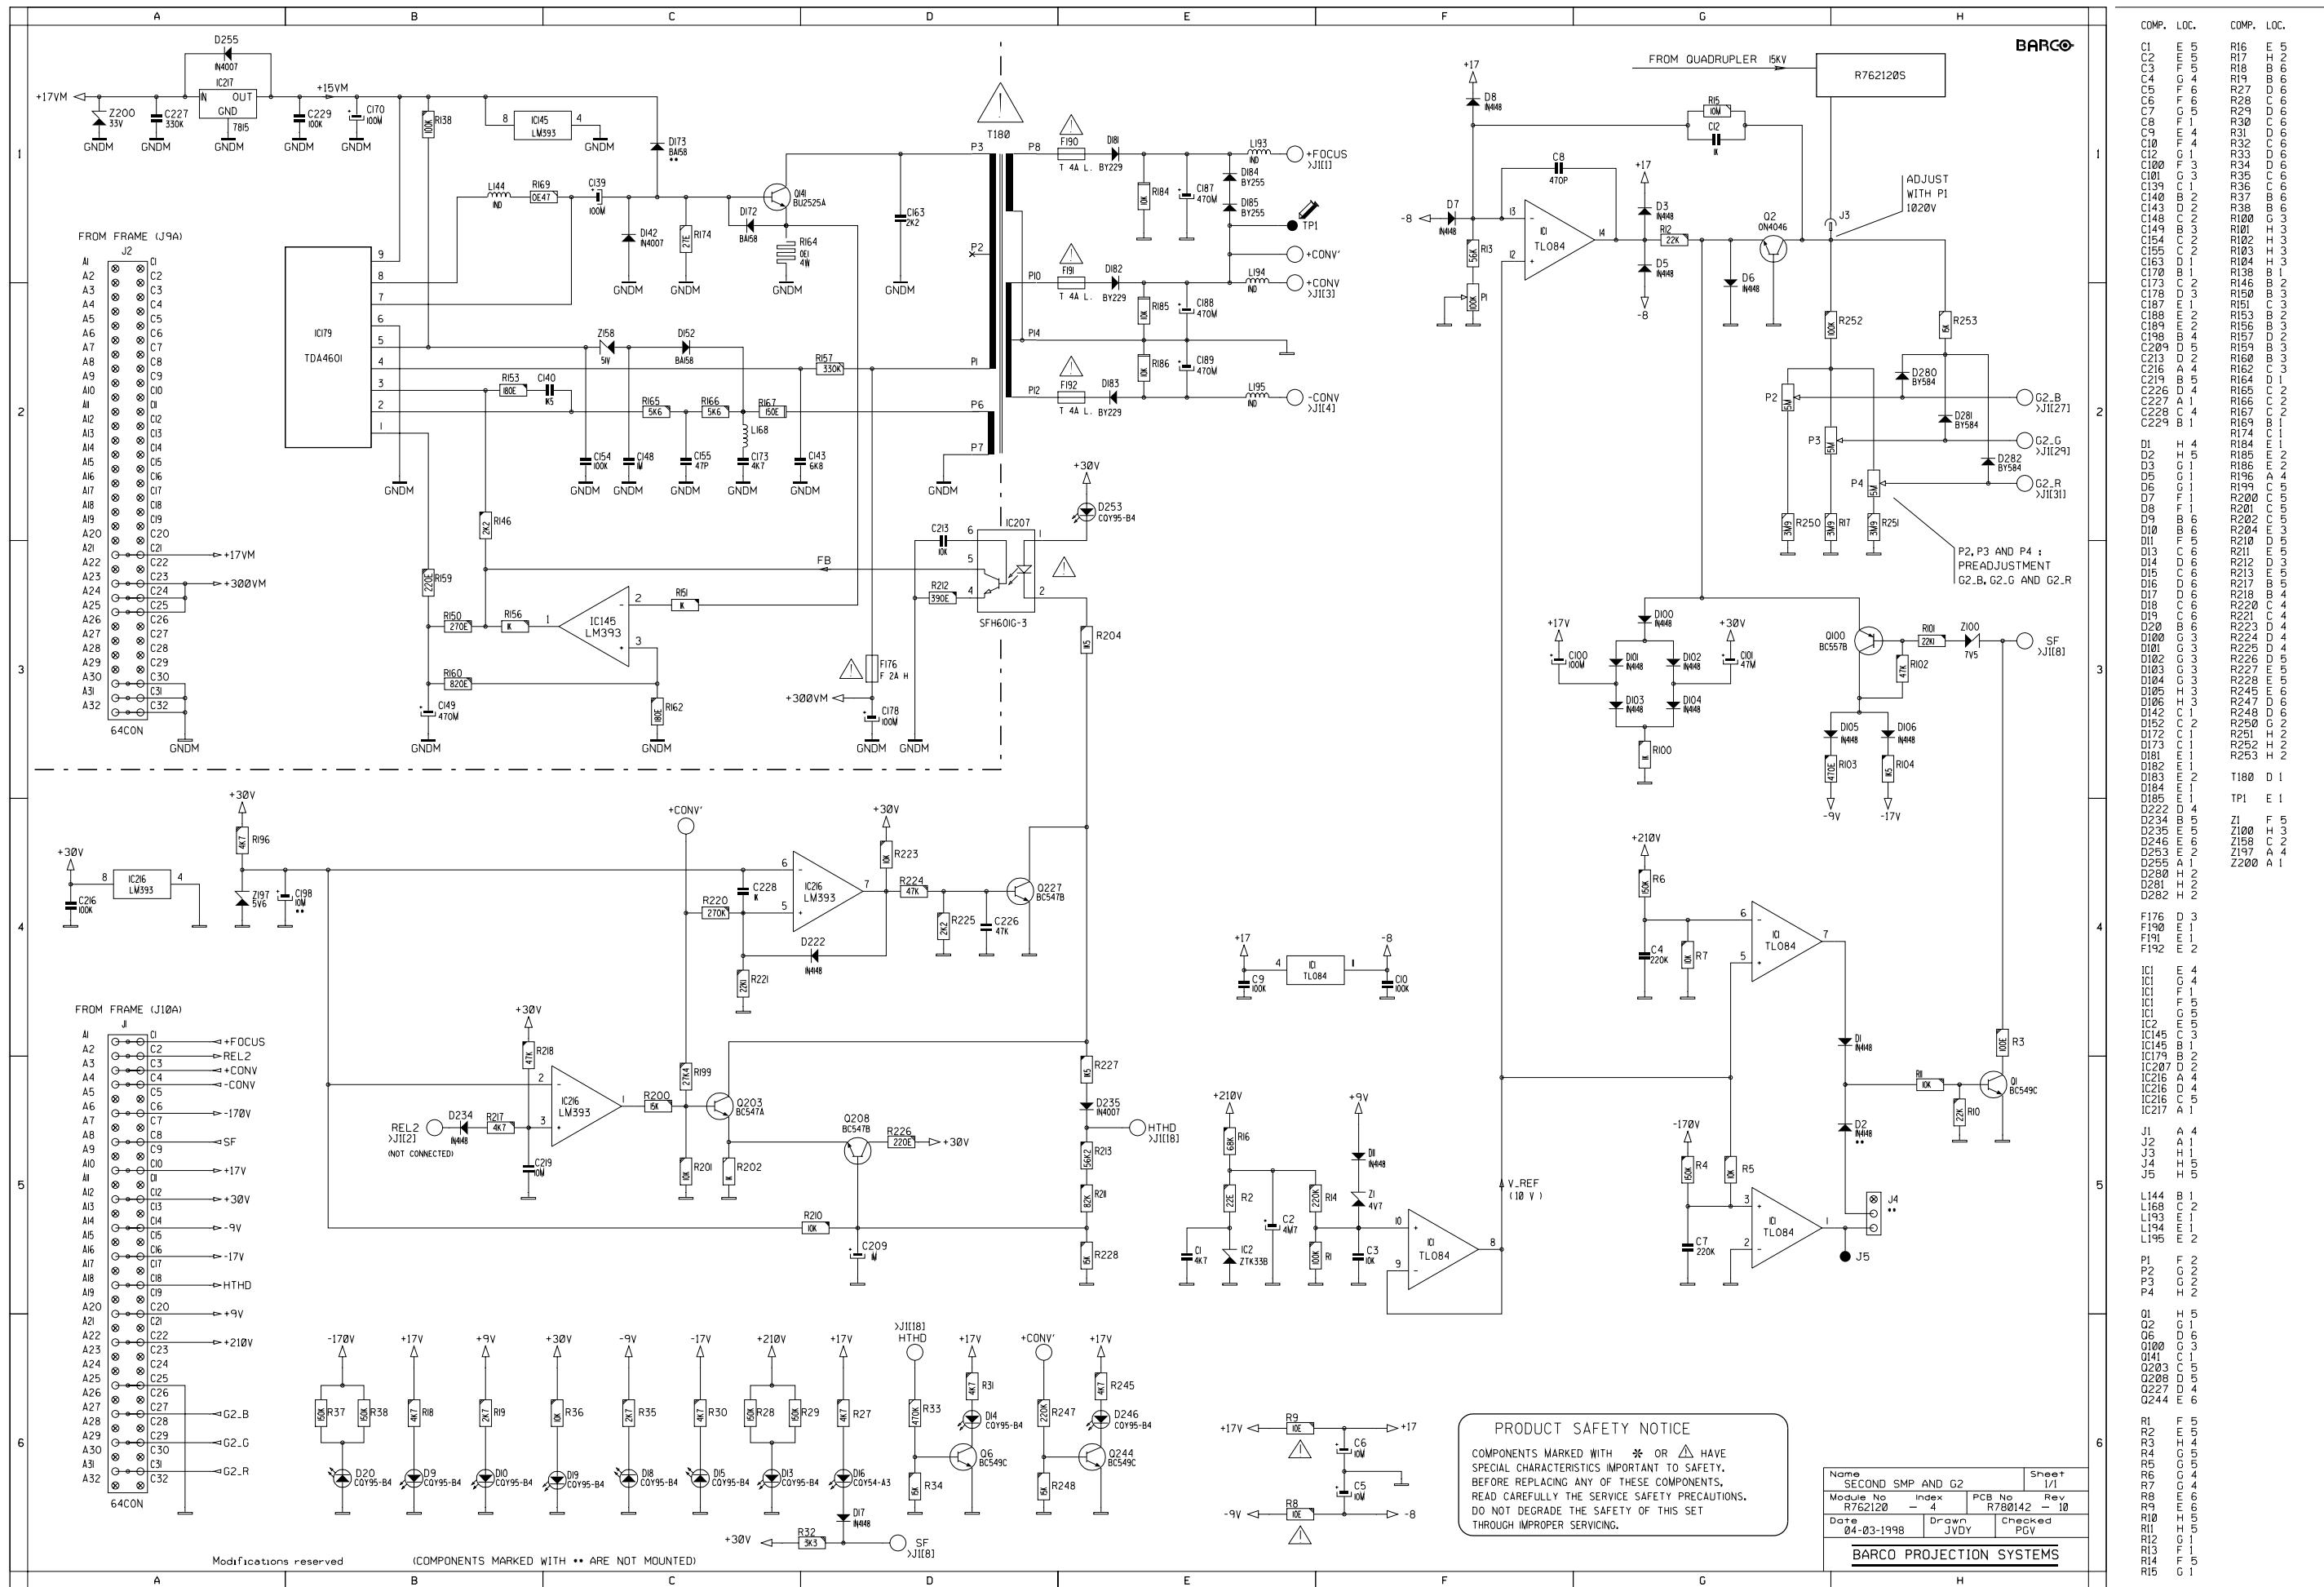

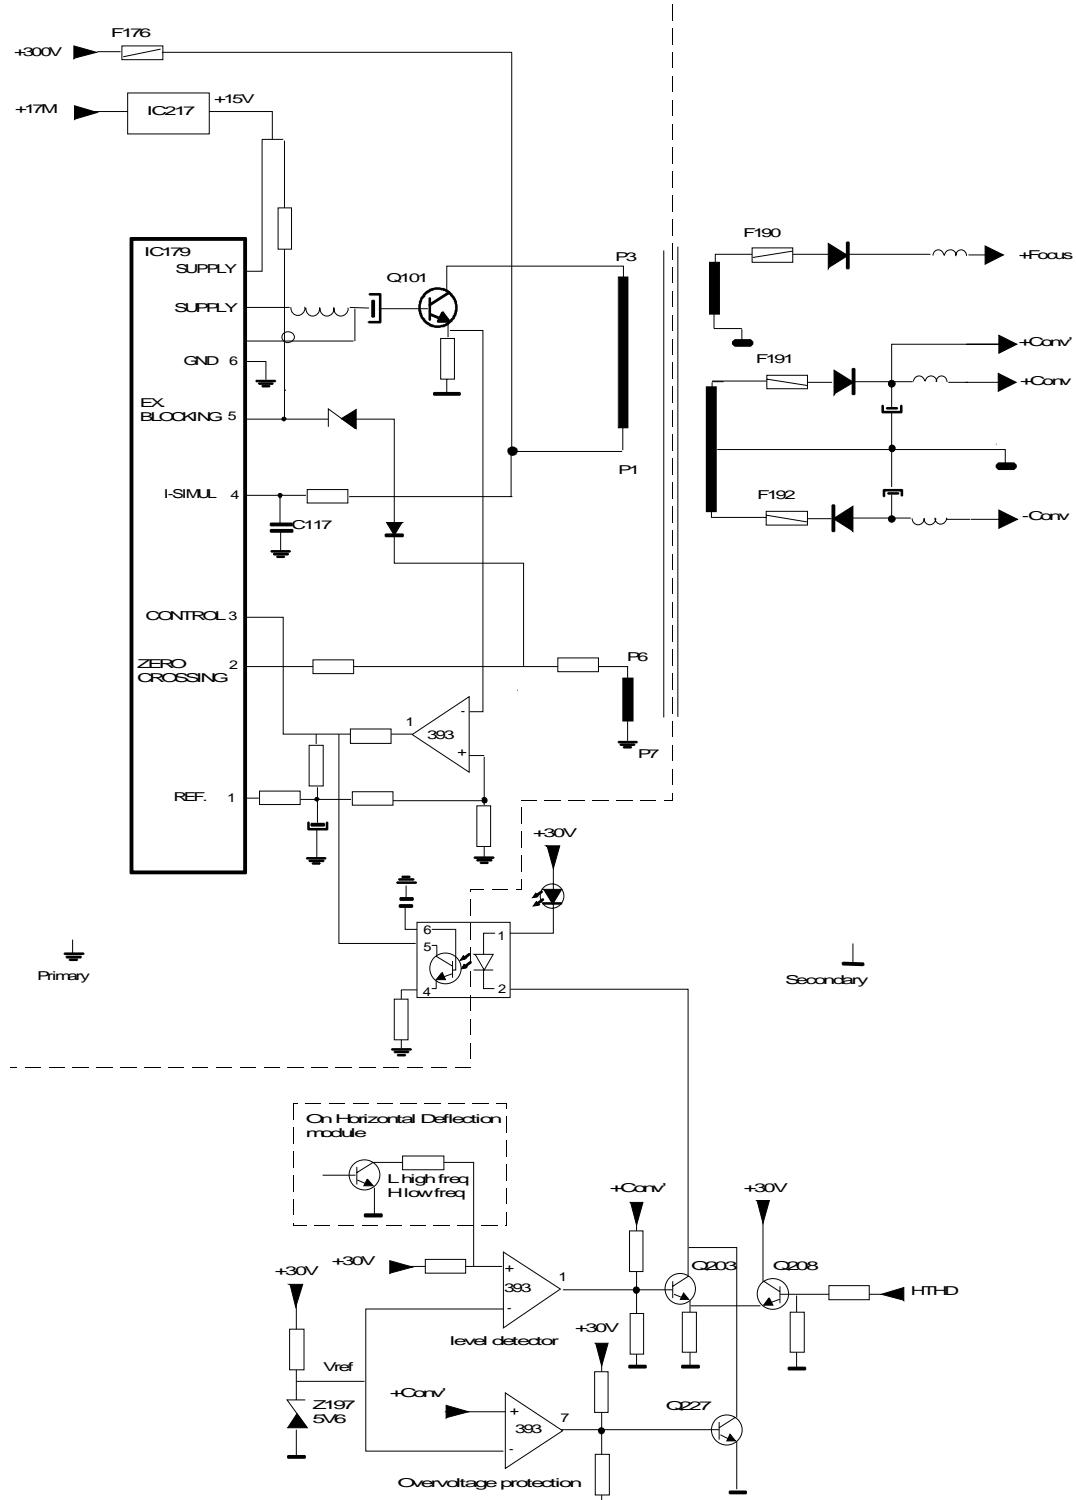

## WARNING

THIS CIRCUIT BOARD IS HOT TO AC. THIS POWER SUPPLY, LIKE THE HIGH VOLTAGE POWER SUPPLY, DOES NOT USE A LINE ISOLATION TRANSFORMER, MEANING A PORTION OF THE CIRCUITRY IS HOT-TO-LINE AND SHOULD BE TREATED WITH CAUTION.

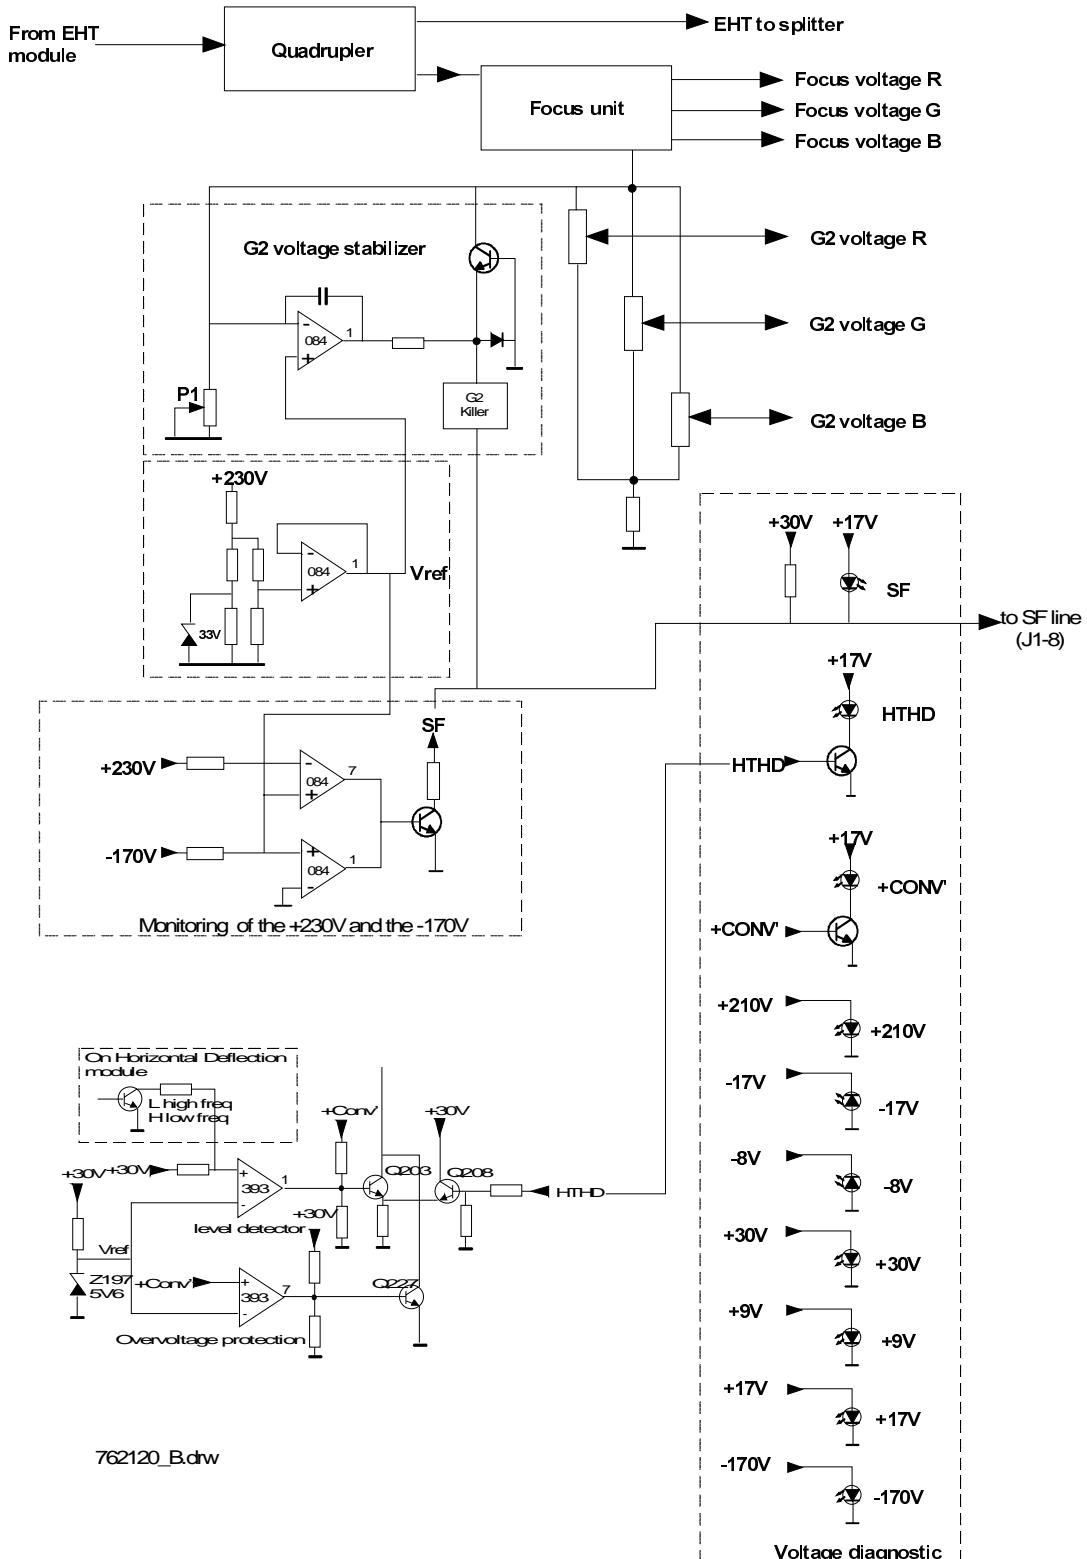

762120\_A.dwg

## Technical description "G2 + DIAGNOSTIC" (76 2120).

### Introduction

This board comprises :

- the SMPS for the convergence end stages and the Focus power stages.
- the stabilisation and alignment circuits of the G2 voltages.
- monitoring circuits of the +210V / -170V to cause scan fail if absent.
- the LEDs for diagnosis of the supply voltages and scan fail.

### A. SMPS for +/- CONV and +FOC voltages.

This power supply uses the same TDA4601 as the main SMPS. We refer to the description of this board for more details. We just limit here to the differences and the control loop to generate the correct amplitude of these voltages.

Because of the high scanning range of the projector, from 15khz to 135khz, we apply a 'tracking' of the power supply with the line frequency. This means the power supply for the power convergence stages increases with the line frequency, but, not in a linear way.

The available information on the line frequency is the +HTHD voltage. However, this voltage is not linearly proportional for the full range of frequencies. Nevertheless, this voltage is used for tracking, but an adaptation of the gain in the feedback will be needed in the second range.

The TDA4601(IC179) totally relies on the +15V(derived from the +17M) delivered by the first or main SMPS and the +300VM.

The transformer and associated rectifier circuits provide the +FOCUS, +/- CONV and the +CONV' for the feedback control loop discussed hereafter.

### B. Control loop / Feedback / Adaptation.

To obtain a tracking with the line frequency, a portion of the +HTHD voltage is applied to the base of Q208.

The main loop is realised by applying the +CONV' voltage to the base of Q203, the error-amplifier. The amplitude of the feedback depends on the status of the output of the level detector LM393 (IC216) , pin 1. If that pin 1 output is low (=ground), R200 is added in parallel on R201. In the other case R200 is hooked up to the +30V (output of level detector).

Pin 2 of the LM393 is set at 5.6 volt with Z197. "REL2" is connected to the collector of Q8 on the HOR DEFL board. For the second range, this line is low or ground level and pin 3 is then lower than the zener voltage. Pin 1 is then at ground level and consequently R200 is put in parallel with R201. The feedback is changed to compensate for the decrease of the +HTHD voltage.

Via an insulating opto-coupler, the collector current of Q203 is transferred to pin 3 of the regulating TDA4601.

The +CONV' voltage is also applied to another level detector in IC216, pin 5. The same reference voltage of 5.6 volts is applied to pin 6. When an overvoltage situation occurs, Q227 saturates and the collector of Q203 drops to ground level. The SMPS switches into a safe loop, whereas the output voltage is dropped to a minimum.

If, on the other hand, the HTHD voltage is too low, the +CONV voltage drops also via D235/R227.

## C. Monitoring of the +210V and -170V.

A very stable Vref voltage is formed with IC2 (33V) and buffered with an OPAMP. IC2 stabilizes a 33 volts which is then divided by R14/R1 to exactly 10 volt and buffered to provide sufficient current.

If the +210V were absent, the Vref would disappear and the monitoring circuit cannot work. The +9V takes over in this case and installs a reference voltage via Z1 / D11. This Vref of 10 volt is used for the level detectors monitoring the supply voltages of the video power stages : the +210V and -170V.

The absence of one or both of these voltages can damage the picture tubes. The Scan Fail line switches low through Q1 as soon one of the voltages drops below some level.

## D. G2 voltages.

### 1. Stabilisation.

The G2 voltages must be very stable to avoid thermal drift, and, they should be adjustable between 400V and 1020 volt.

The voltage coming from the unit 762120S is already very stable since it is coming from a stabilised source, the EHT.

The series output resistor in the unit forms together with P2, P3, P4 and R17 a divider. If we can stabilize the voltage at the node mentioned "Adjust for 1020V with P1" we also have a stable G2 voltage at the sliders.

That 1020 volt point is sensed with the divider R15 / R13 / P1. Since the Vref is 10volt, the output of the OPAMP will change until pin 13 is also at 10 volt.

Any voltage difference due to a change of the 1020 volt is adjusted by Q2 which will feed a current from to the (negative) output of the OPAMP via the "voltage dropping" Q2 transistor. Note that Q2 is needed because the 1020 volts is a too high voltage for the OPAMP. A high voltage transistor such like the ON4046 (BU508A) is therefore required.

### 2. G2 - Killer.

The G2 voltages must drop very quickly to zero in the event of a scan failure and at switching off the projector. There is a risk that the spot suppression does not sufficiently work when these voltage are too high.

The drop of the G2 voltage is realised with D100-D104 taking the heavy drop of the +17V and +30V at information to cause a heavy conduction of Q2.

In the event of a scan failure, Q110 gets forward biased as its emitter Q2 becomes negative.

## E. LEDs for diagnosis.

The presence of the various voltages are all displayed with green LEDs. The variable voltages like the +HTHD and +CONV' drive a LED through a transistor to obtain a constant light output of the LED.

The scan fail diode D16 is red and shows that there is a problem in the horizontal or vertical deflection (see these boards for more explanations).

## ADJUSTMENT PROCEDURE 'G2 CONTROL+DIAGNOSTIC MODULE'

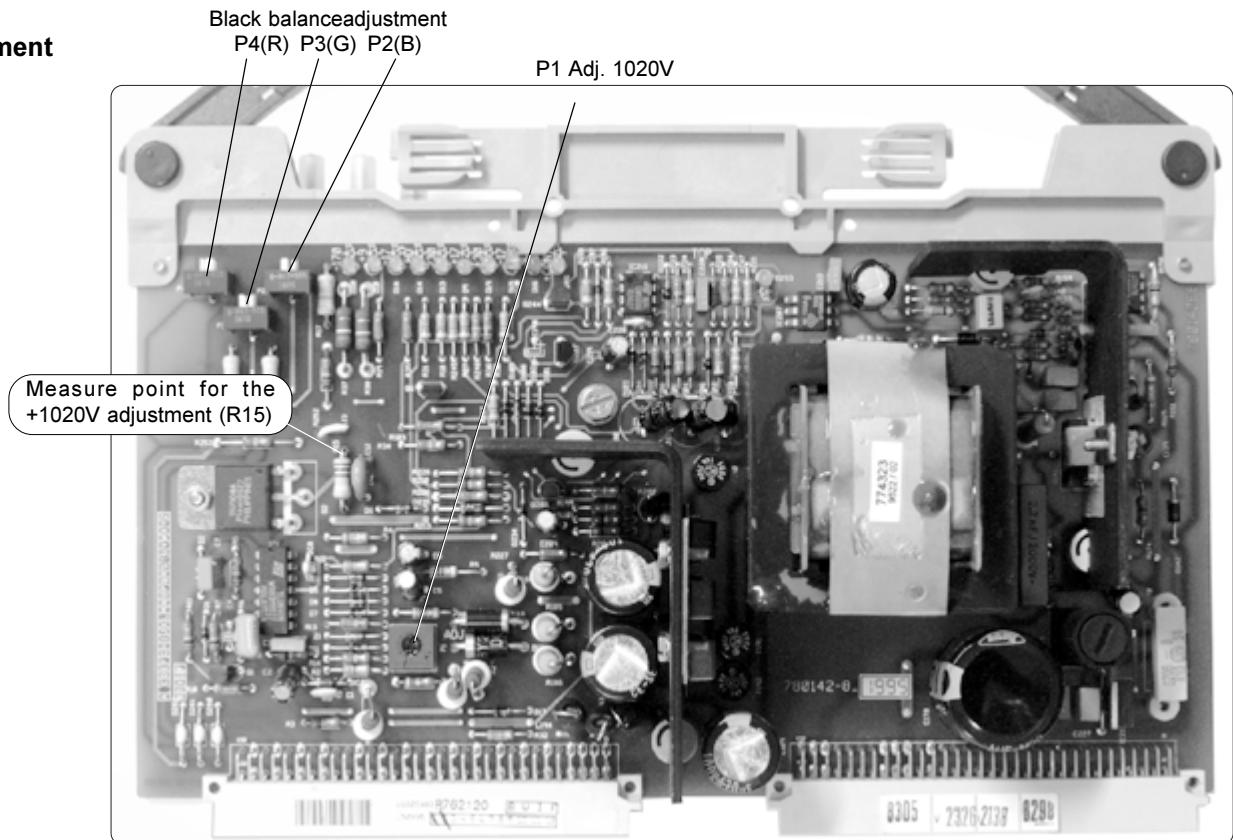

The alignment is restricted to the adjustment of :

- alignment of the +1020V
- pre-alignment of the BLACK BALANCE

## HIGH VOLTAGE WARNING

**To avoid DANGER TO LIFE, do not attempt to service the chassis until all precautions necessary for working on HIGH VOLTAGE equipment have been observed.**

### Alignment

### Preparation

**WARNING: The power must be OFF before removing any connector from circuit board or unit. Failure to do so may result in severe damage to the projection unit.**

- Turn the projector off.
- Put the module on the extension boards.
- Connect to the VIDEO input e.g. an electronic colour test video signal.
- Switch the projector in the VIDEO MODE. Select source 1.

## Alignment +1020V

- Connect to the resistor R15 (side wire soldering J3) a precision **focus** probe.

**CAUTION: read carefully all safety instructions, mentioned in the user's manual of the precision focus probe.**

- Switch on the projector.
- Adjust the potentiometer P1 for +1020V read out.

## Black balance

- Connect to the video input a colour bar signal.
- Proceed to **Random access adjustment mode** and highlight **color balance**.

Press **ENTER** to display menu R10 (refer to owner's manual of the projector)  
Use the arrow keys to select *black balance* and then press **ENTER**.  
Adjust the "cut off" for each color for a bar scale level of 50.

- Adjust CONTRAST to minimum (number indication below the bar scale of 0) and COLOUR until colour is off.
- Adjust BRIGHTNESS to mid-position (number indication below the bar scale of 50).

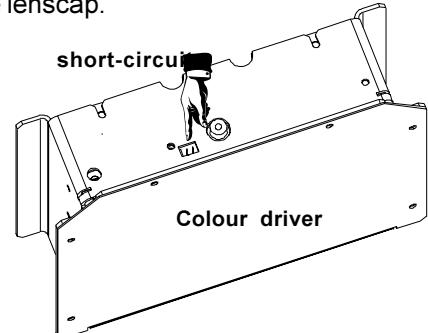

Proceed to the pre-adjustment of the black balance P2(B)-P3(G)-P4(R)  
Observe the bars on the screen. If any trace of color appears on the black or white bars then perform the following adjustments in low ambient light.

- Cover the blue and the red lens with the lenscap.

Short-circuit the two pins on the top side of the respective colour driver, see illustration.

Adjust the Green G-2 control P3 until the green raster is just visible on the screen.

Remove short-circuit

- Cover the green and the red lens with the lenscap.

Short-circuit the two pins on the top side of the respective colour driver, see illustration.

Adjust the Blue G-2 control P2 until the blue raster is just visible on the screen.  
Remove short-circuit

- Cover the blue and the green lens with the lenscap.

Short-circuit the two pins on the top side of the respective colour driver, see illustration.

Adjust the Red G-2 control P4 until the red raster is just visible on the screen.  
Remove short-circuit

## Remove the lenscaps

The raster on the screen should appear white.

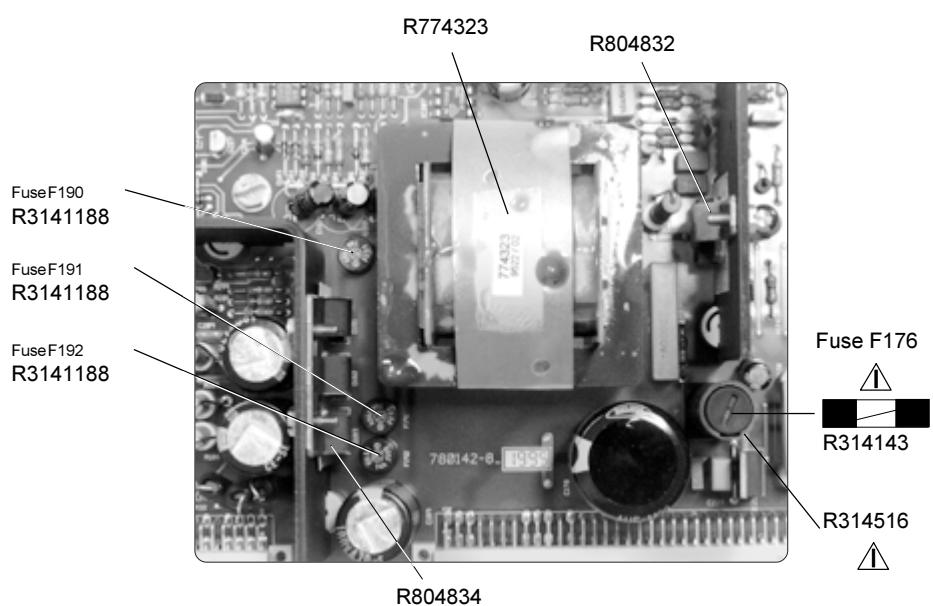

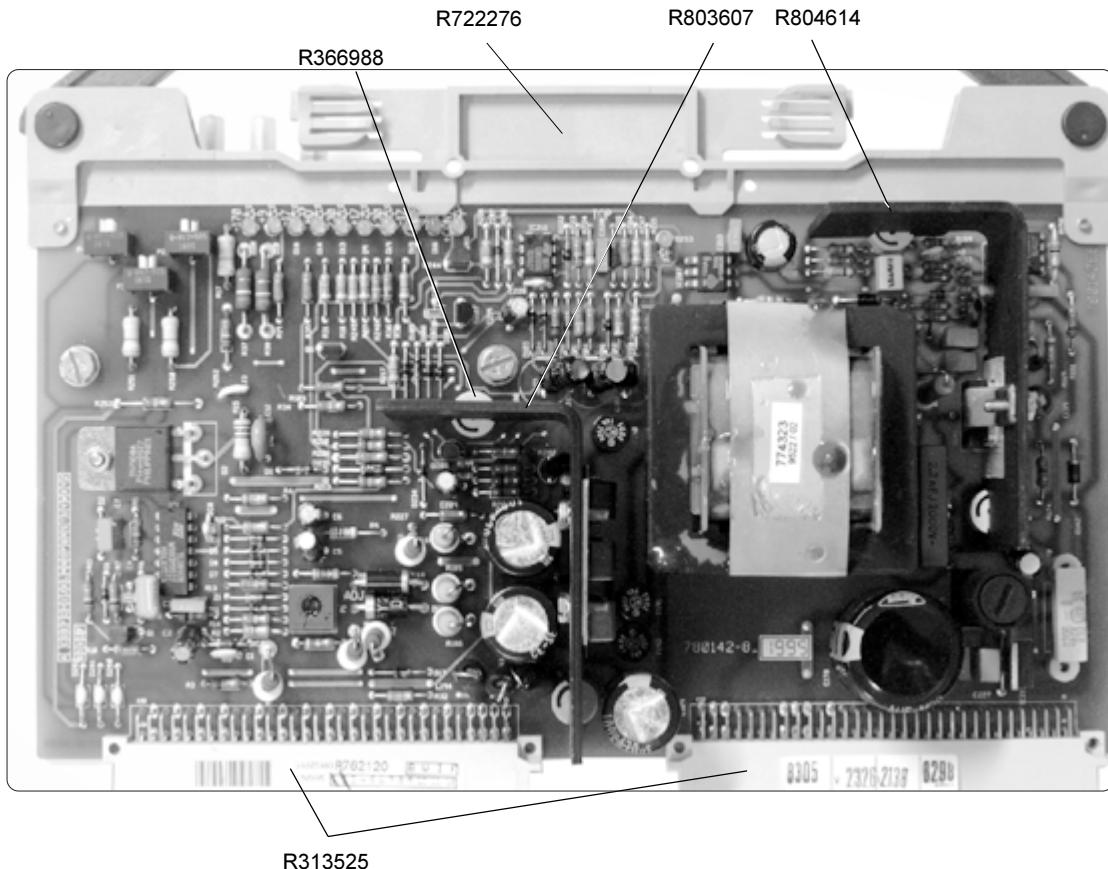

Note: if any coloration is still visible, then adjust the **black balance** ( Red cut-off, and Blue cut-off) in the **Random access adjustment mode** slightly to eliminate any trace of colour.

Re-adjust brightness and contrast for optimum picture. There should be no coloration between shades of gray.

Re-adjust color control at normal.

## TBA2800 Infrared Preamplifier IC (14-Pin Plastic Package TO-116)

Bipolar integrated circuit intended as a receiver preamplifier for the infrared-remote control systems designed with the SAA1250 integrated circuit.

The TBA2800 preamplifier IC contains four main parts:

- gain-controlled amplifier I
- amplifier II
- pulse-separating amplifier III and
- inverter IV

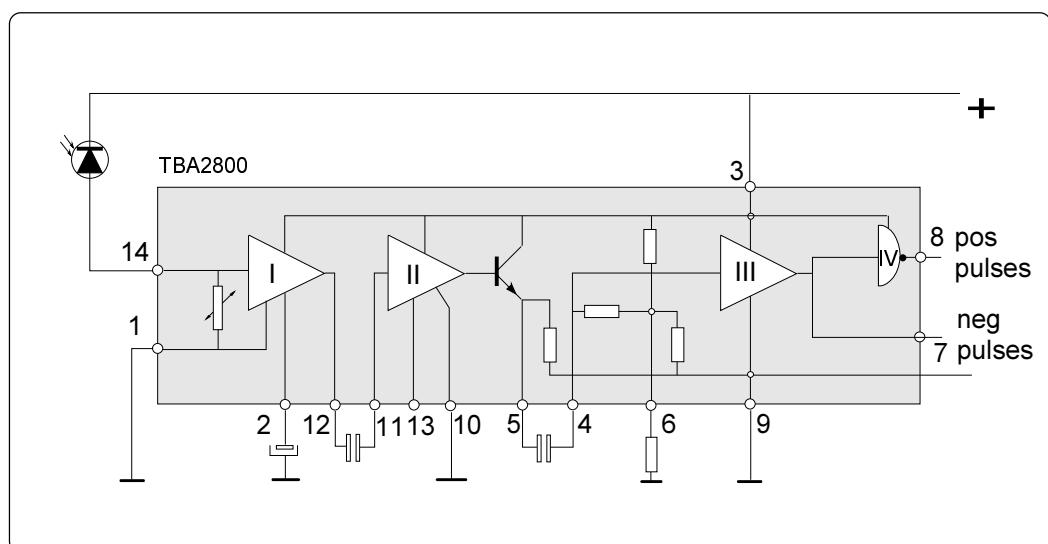

Amplifier I has a wide dynamic range and thus ensures interference-free operation, even at bright ambient light or at intensive infrared light as it comes from infrared sound transmissions or at bright 50 Hz modulated lights as it originates from fluorescent lamps.

It is also possible for the remote-control transmitter to be near the receiver without causing malfunctions by overdriving the receiver.

Amplifier II further amplifies the signal, and amplifier III separates the pulse-shaped intelligence signal from noise and other unwanted parts.

The additional inverter IV inverts the negative output pulses at pin 7 and thus delivers positive output pulses at pin 8.

If an additional resistor is inserted between pin 6 and GND, noise immunity is increased. But this is accompanied by decrease in sensitivity.

## Introduction

Repairing the Barco 800 series projectors on component level is made possible by using the extension boards and the extensions cable units, delivered as **service kit**.

## Using the extension boards for Euro cards

### How to extract a module

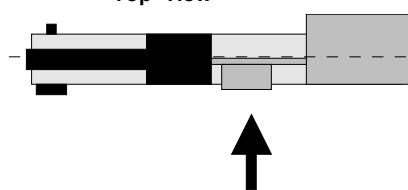

Each board is locked in the main chassis on both sides.

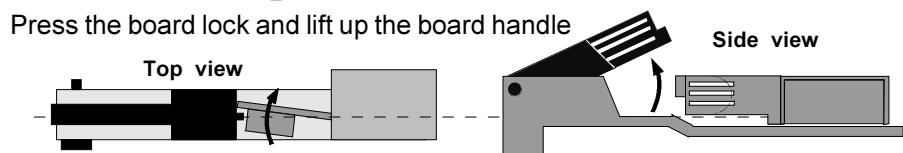

To unlock the board, proceed as follows:

Refer to illustration:

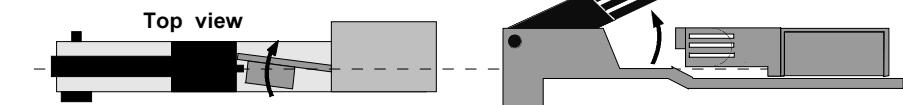

Top view

Side view

Press the board lock and lift up the board handle

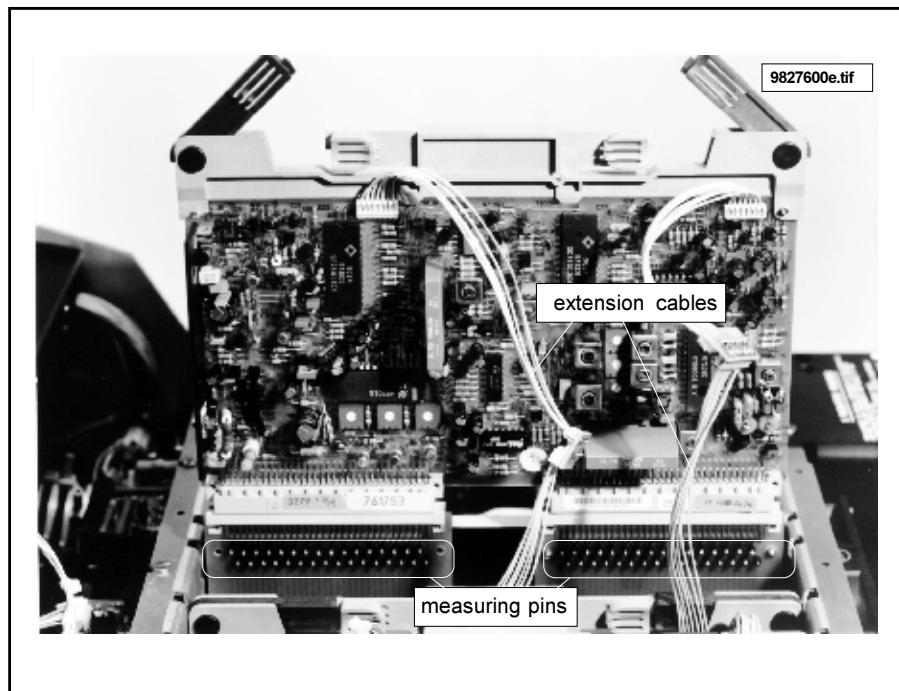

Side view

Repeat this action on both sides of the module and extract the module out of the main frame.

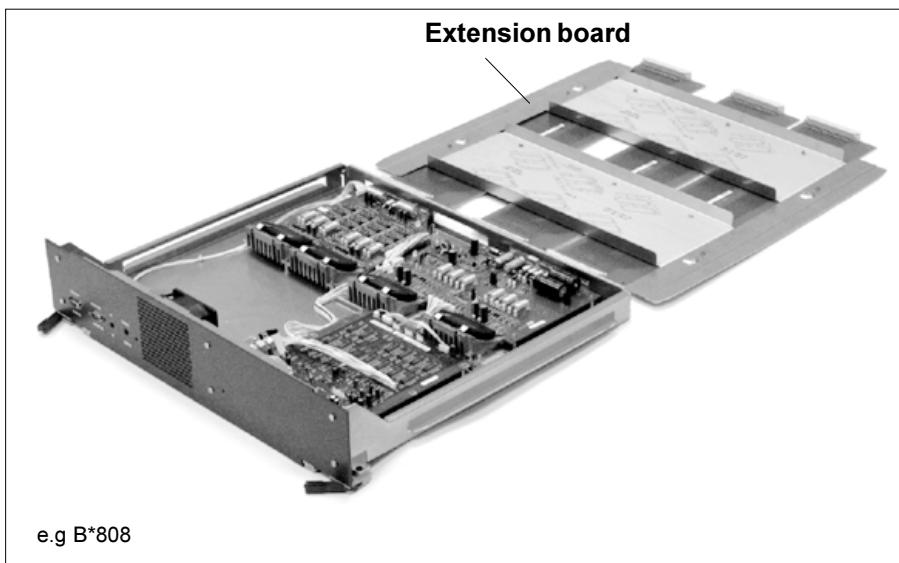

## Example: repairing the decoder module

- Unplug the two connection cables to and from the Decoder module.
- Remove the Decoder module out of the main frame as already described.
- Plug the extension boards on the two decoder board connectors on the main frame.
- Put the Decoder module on the extensions boards.
- Re-install the cable connection by inserting the extension cables.

**Important:** the extension board for Eurocard is provided on each printed circuit foil with measuring pins.

**Using the extension board for the Convergence module**

**External remote infrared receiver:**

**the all-seeing eye for BARCO projectors**

BARCO's external infrared remote receiver facilitates the use of the projector's infrared remote control in difficult installations.

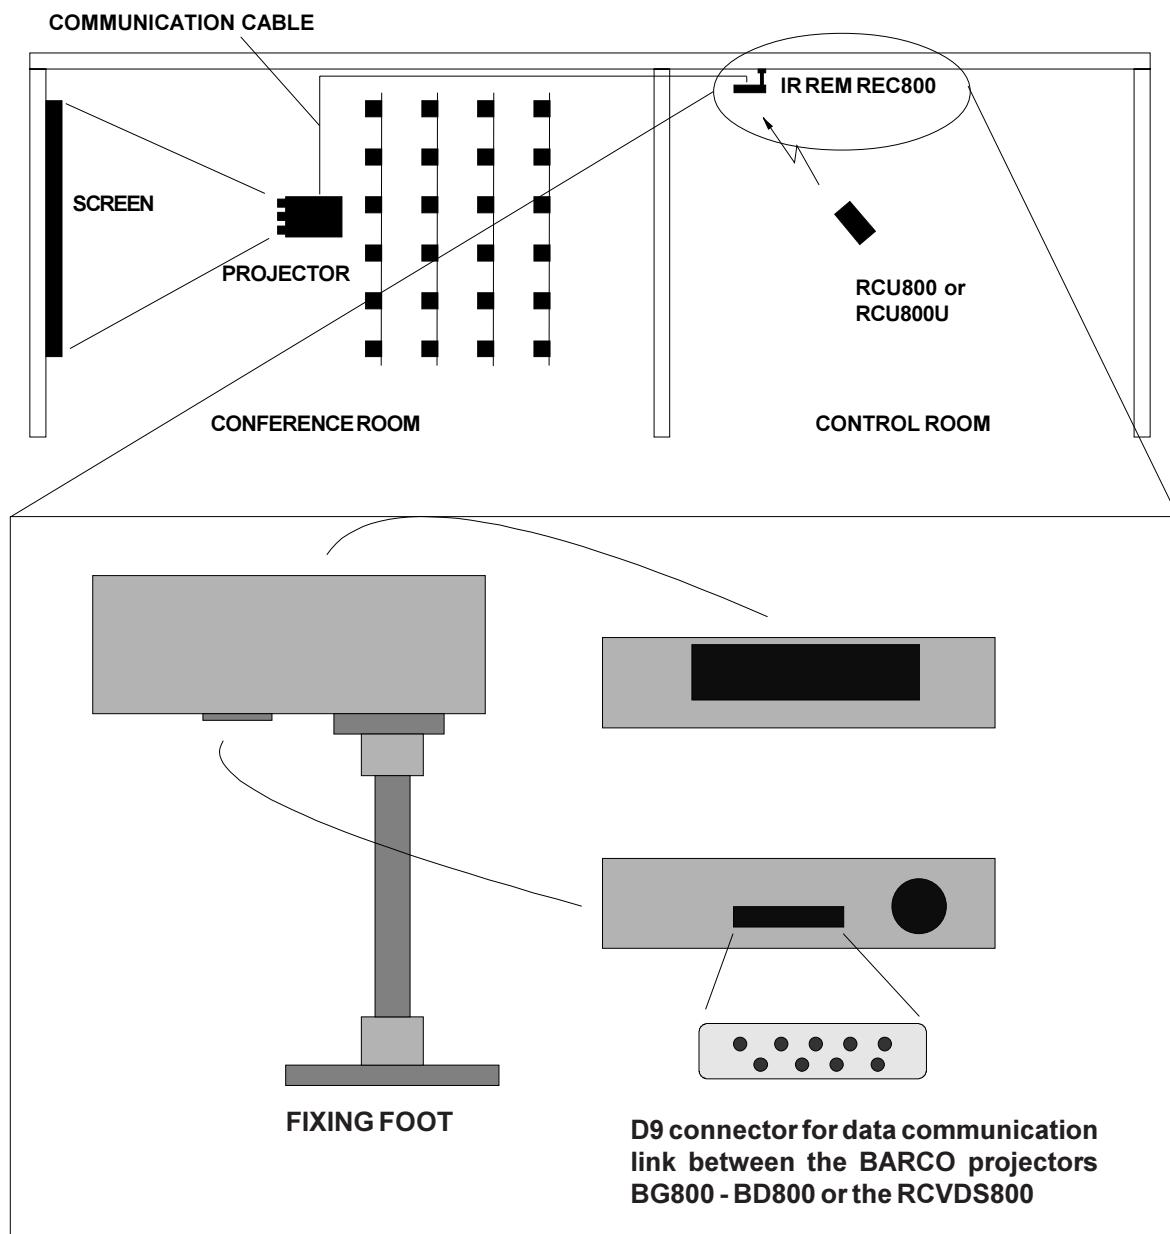

The infrared receiver can be directly hardwired to any digitally controlled BARCO projector or through a switcher. A LED display indicates the selected source number. The special flexible fixation arm of the receiver allows to fix it in almost any position on the ceiling or wall.

## MOUNTING INSTRUCTIONS for the INFRA RED REMOTE RECEIVER 800 (98 27515)

This stand-alone IR Receiver connected to the BG 800 - BD800 projectors or the RCVDS800 with the available D9-D9 communication cable, refer to info sheet 59 75134, allows to transfer the IR signals from the RCU800 or RCU800U to the projector and displaying the selected input.

### OPERATION

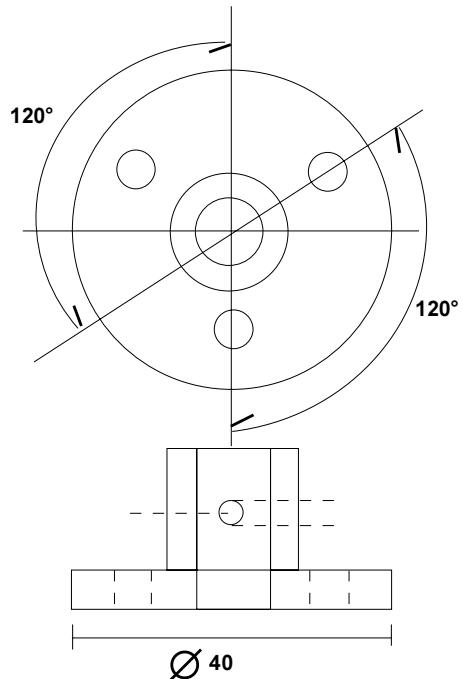

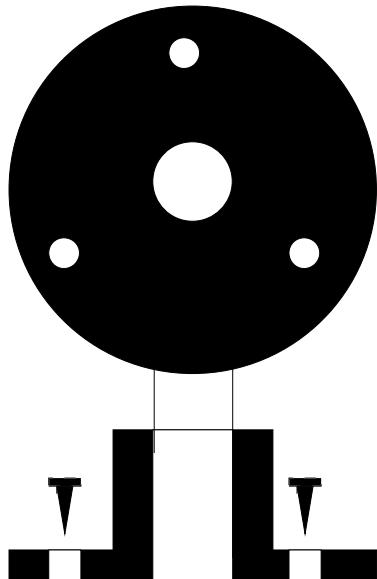

Point the IR transmitter RCU800 or RCU800U at the front side of the IR Remote Receiver 800 (face with window).

Refer to owner's manual of the respective projector or RCVDS800 for further instructions about the use of the IR remote control.

# IR Remote Receiver 800

R9827515

## Mounting instructions:

Mount the fixing foot of the IR Remote Receiver on the wall by means of three screws.

Install the communication connection between IR REMOTE RECEIVER and the PROJECTOR 800 serie by means of the D9-D9 communication cable.
